Electric Market Overview: 2008 Review of Wind

2008 Review of Wind Capacity and Generation

- Installed wind capacity grew 8,358 MW to 25,170 MW in 2008 from 16,818 MW in 2007, a 50% increase. Wind power was 43% of new U.S. new electric capacity in 2008, surpassing gas-fired generation.
- Installed capacity grew at a compound annual growth rate (CAGR) of 39% from 2004-08, compared to 28% for 2003-07

National wind policy and developments included:
- Congress extended the production tax credit (PTC) through Dec 2009. Indexed to inflation, it is now worth 2.1¢ per kWh for the first ten years a project operates.
- In Feb. 2009, Congress extended the credit through 2012, its longest renewal ever. This extension provides developers and equipment companies better long-term assurance to invest in projects and manufacturing facilities. The three times the PTC lapsed this decade were followed by declines in new capacity in subsequent years: 2000, 2002, and 2004 (see next chart, “Growth in Installed U.S. Capacity”).
- Foreign turbine, tower, and component manufacturers have opened U.S. facilities with the PTC’s steady renewal, lowering equipment transportation costs. In 2008, 30 facilities were announced, 10 opened, and 18 existing facilities expanded; 9 came online and 11 were announced in 2007.
- The economic downturn has led to some facility cutbacks, employee layoffs, project delays, and equipment order postponements.

State policies encouraged wind’s growth:
- 16 of the top 25 states by cumulative MW had an RPS (14 in 2007), 3 had renewable goals (3 in 2007) while 6 had neither.
- 34% of 2008 capacity additions – 7,454 MW – were in the 20 states with the highest wind potential; 86% of total U.S. wind capacity – 21,741 MW – is in those states.

State policies (continued):
- 80% of total U.S. wind is in the top ten states. The top 5 states by installed capacity (new 2008 MW) are:
  - Texas: 7,116 MW (2,670)
  - Iowa: 2,790 MW (1,519)
  - California: 2,517 MW (78)
  - Minnesota: 1,752 MW (454)
  - Washington: 1,375 MW (212)
- Texas kept its lead as the state with the most wind capacity; Iowa passed California for 2nd place. Oregon and Colorado each have more than 1,000 MW installed.

The Commission acted to improve wind interconnection:
- Wind’s rapid capacity growth created a backlog in many interconnection queues. FERC held a technical conference in December 2007 (AD08-2) to re-examine its Large Generator Interconnection Rule (Order 2003). ISOs and RTOs reported that queuing procedures specified in the Order impeded their timely interconnection of wind resources.
- In March 2008, FERC directed RTOs and ISOs to report on the status of their efforts to improve the processing of projects in their queues; it offered guidance on reforms including increased staffing, more efficient modeling, or clustering requests. Queue reform Orders were subsequently approved for the Midwest ISO (2008), California (2008), and ISO-New England (2009).
- FERC accepted the tariff provisions NYISO proposed, which allowed it to implement a centralized program to incorporate wind output into its day-ahead and real-time energy markets. Ongoing costs are recovered from wind plant operators.

*CAGR is a better indicator of growth rates over time than a straight percent.
**Interconnection Queuing Practices, 122 FERC ¶ 61,252 (2008)

**Notes:** *31 states if WV’s Governor signs the Alternative & Renewable Energy Portfolio Act, passed 6/2/09. An RPS requires a percent of an electric provider’s energy sales (MWh) or installed capacity (MW) to come from renewable resources. Most specify sales (MWh). Map percents are final years’ targets. *TVA’s goal is not state policy; it calls for 50% zero- or low-carbon generation by 2020. Alaska has no RPS. Sources: Derived from data in: LBNL. **RPS in the U.S. through 2007** (4/08). PUCs, State legislative tracking services, Pew Center, and the Union of Concerned Scientists. June 2009
Electric Market Overview: Renewable Portfolio Standards

Federal Energy Regulatory Commission • Market Oversight @ FERC.gov

Renewable Energy Portfolio Standards

- A Renewable Portfolio Standard (RPS) requires a percent of energy sales (MWh) or installed capacity (MW) to come from renewable resources. Percents usually increase incrementally from a base year to an ultimate target. The percents on the map are ultimate targets.
  - 30 states – including D.C. – have renewable mandates.
  - Six have renewable goals without financial penalties.

- Recent National Renewable Actions:
  - The House Energy and Commerce Committee approved the Waxman-Markey bill (May 21). It compromised on a national Renewable Energy Standard of 15% by 2020; 5% of the standard can be met by EE. If a state’s governor determines that local utilities cannot meet the requirement, the renewable target can be reduced to 12%, but EE would increase to 8%. HR 2454 was referred to nine committees.
  - The Senate Committee on Energy and Natural Resources began to mark-up its national renewable electricity standard (June 4). The Senate bill has no climate provisions. It includes a renewables target of 15% by 2020; utilities could meet one-fourth with EE.

- Recent State Renewable Actions:
  - Kansas became the 30th state with an RPS when Gov. Mark Parkinson signed a 20% by 2020 bill (May 22). HB 2369 was swiftly passed as part of a compromise that allows a group of Kansas co-ops to expand the Holcomb coal plant by 895 MW.
  - West Virginia passed an Alternative and Renewable Energy (A&RE) Portfolio Standard in a special legislative session (June 2). It calls for 25% of electricity sales to come from A&RE resources by 2025, including advanced coal technologies. Credits may be awarded for EE, DR, or GHG emissions reductions. Gov Manchin is expected to sign it.
  - California’s Assembly passed AB 64 which would codify their 33% RPS, now an Executive Order. The Senate has passed two bills that include a 33% RPS.

- State Actions (continued)
  - Nevada Gov Gibbons signed bills that create a RE and EE Authority, raise distributed generation (DG) and RE goals, and enhancing RE loan and tax incentives (5/29). The whole RPS increases to 25% by 2025; the solar set-aside to 6% starting in 2016. SB 358 creates a Solar Systems Incentive Program and raises the DG cap 9% annually for 10 years, possibly resulting in 97 MW new DG by 2021.
  - Massachusetts published final regulations for Class I and II renewables for “the Green Communities Act,” its RPS amended in 2008 (May 29). The regulations also cover an Alternative Energy Portfolio Standard, which supports non-renewable but innovative energy technologies.
  - Illinois passed an amended RPS to include Alternative Energy Suppliers (in addition to regulated utilities for default service customers), added a 6% solar target, and created a Renewable Energy Resources Fund. It went to the Governor to sign (May 19).

- States include alternative RPS technologies:
  - 4 states already include alternative energy provisions to meet a portion of their RPS, including IL (25%), PA (up to 10%), OH (up to half), and MI (up to 10%). A large portion of power in these states has historically been coal-fired; cleaner alternatives were important to RPS passage. Alternatives include advanced coal technology, coal bed methane, coal gasification (IGCC), and waste coal. Many also include municipal solid-waste, or waste-to-energy.
  - 16 states include EE in their RPS or renewable goals.
  - 14 states include a solar or distributed-energy (DG) set-aside in their RPS. States with solar in are: AZ, CO, DC, DE, IL, MD, MO, NC, NH, NJ, NM, NV, NY and PA; MA has goal. States with DG include: AZ, NV, NY, and WA.

Updated June 8, 2009
18 States have Energy Efficiency Resource Standards

NE: Energy Plan stresses multi-sector EE improvements
KS: Advocates voluntary utility programs, not mandate
OK: PSC approved quick-start DR programs, including EE
MN: 1.5% annual savings based on prior-3 years average, to 2015
IA: utilities to submit EE goals to achieve 1.5% annual savings; awaiting approval
MI: 1% annual savings from prior year’s sales to 2012
WI: EE in RPS
IL: reduce energy 2% by 2015 (EE) and 0.1% from prior year (DR)
OH: reduce peak 8% by 2018; 22% energy savings by ’25, starting 2009
KY: proposed RPS-EE to offset 18% of projected 2025 demand
ME: 10% EE by 2017 – new since 2005; DR & EE as SOS priority resources
VT: 2009 – 2011 goals of 2% annual savings; administered by Efficiency VT
MA: 25% of electric load from DSR, EE by 2020: capacity and energy
NY: 15% electric use reduction by 2015 from levels projected in 2008
CT: 1.5% annual savings 2009-19, from 2007, using all cost-effective EE
RI: reduce 10% of 2006 sales by 2022
NJ: BPU proceeding on EERS to reduce consumption, peak demand
DE: creating a Sustainable Energy Utility; EE, RE, DG, DR as SOS priorities
PA: reduce energy consumption 3% and peak 4.5% by 2013 as percent of 2009-10 sales
MD: reduce per cap electricity use & peak 15% by 2015 from 2007
VA: reduce 10% of 2006 sales by 2022
NC: EE to meet up to 25% of RPS to 2011; later to 40%
TVA: reduce peak demand 1,400 MW by 2012 with EE, DR *
FL: PSC to adopt new goals to reduce electric consumption, peak demand
WA: must pursue all cost-effective conservation
OR: IOU 2008 goals 34 MW; administered by Energy Trust OR
CA: 1% annual energy savings 2004 – 2013 ~23,183 GWh, 4,885 peak MW by 2013
ID: Energy Plan sets conservation, DR, EE as priority resources
MT: Governor’s initiative – 20% state agencies energy savings by 2010
NV: EE up to 25% of RPS by 2015
UT: EE incentives in RPS goal
CO: 11.5% energy savings 2009 – 2020 ~ 3,669 GWh
NM: use EE and DR to save 10% of 2005 retail electric sales by 2020
TX: 20% of load growth by 2010, using average growth rate of prior 5 years
HI: 20% savings of net electric sales by 2020; up to 50% of RPS

* TVA’s “EE and DR Plan” is from the Public Power Authority, and is not a state policy.

**Abbreviations:** DG – distributed generation; DR - demand response; DSR – demand-side resources; EE - energy efficiency; E&G: electric and gas utilities; IRP – integrated resource plan; RPS: Renewable Portfolio Standard; SOS: Standard Offer Service

**Sources:** ACEEE, EPA, Regulatory Assistance Project, Union of Concerned Scientists, State regulatory and legislative sites; State Efficiency Agency reports; trade press

**Updated April 3, 2009**
Energy Efficiency Resource Standards (EERS)

An EERS – Energy Efficiency Resource (or portfolio) Standard – aims to reduce or flatten electric load growth through energy efficiency (EE) measures. Goals may specify reductions in energy (MWh), demand (MW), or both. Many specify both overall energy reductions and peak-load reductions.

Energy Efficiency (EE) is using less fuel to produce the same or greater amount of usable energy from a given energy source. EE actions usually have a multiple-year effect. EE is different from conservation, which can be temporary energy use reductions.

ENERGY EFFICIENCY IN THE STATES:

Eighteen states have an EERS. Twenty-eight have EE standards or goals as an EERS, a utility goal, or as part of a proceeding. At least 18 include EE as part of a renewable standard or goal.

Three states have a pending EERS while they develop details to implement legislation: FL, MA, and NJ. Utilities in IA and RI must file plans showing EE reduction goals or plans. KY and NE Energy Reports published in late 2008 suggested an EERS.

14 states passed significant energy efficiency legislation or regulations in 2008, including: DC, FL, HI, IA, MA, MD, MI, NJ, NM, NY, PA, OH, OK, UT, and VT.

Many states use special-purpose agencies to administer EE programs and goals, including CT’s Energy Conservation Management Board; NJ’s Clean Energy Board, NYSERDA; Efficiency Maine; Energy Trust of Oregon; and Efficiency Vermont. D.C. and Delaware are creating Sustainable Energy Utilities. Hawaii will use a third – party coordinator.

ACEEE named 5 states in its 2008 State Energy Efficiency Scorecard as EE leaders: California, Oregon, Connecticut, Vermont, and New York.

Energy savings in some states with long-standing programs recently reported results:

- CA: utilities met 1.5% of the state’s electric needs in 2007 – over their annual 1% goals.
- Energy Trust Oregon anticipates 2008 electricity savings of “a34 MW”* (297,840 MWh equivalent), nearly the “a35MW” saved in 2007.
- CT: utilities filed plans to average 1.5% of annual needs in response to a requirement to acquire “all cost-effective efficiency.” The ECMB reported 368,000 MWh savings across all sectors for 2008.
- VT: EV met 1.75% of the state’s electric needs in 2007; preliminary 2008 data anticipate 1.8% savings.

NATIONAL ENERGY EFFICIENCY LEGISLATION:

Reps. Henry Waxman and Edward Markey introduced the “American Clean Energy and Security Act of 2009” March 31. Title II, Energy Efficiency, proposes national minimum levels of electric and natural gas savings from 2012 – 2020, measured by average annual sales during the two preceding calendar years. Cumulative electric savings would begin in 2012 at 1% and ramp to 15% in 2020. Cumulative gas savings would begin at 0.75% and reach 10%. The bill specifies that states should consider EE as a resource in utility planning and procurement and seek to procure all EE that is available at lower cost than energy supply options.

* “aMW” is average MW without a time factor; MWh equivalent is: MW saved times the number of hours in a year.

Collaborative Regional GHG Programs:
- Three North American groups with goals to lower regional GHG emissions were initiated by state Governors.
- 32 U.S. states, D.C., eight Canadian provinces, and six Mexican states are Participants or Observers.
- Observer jurisdictions do not commit to group GHG reduction goals, but participate in proceedings should they opt to join later. RGGI Observers are not on its Board.

Western Climate Initiative (WCI):
- Created February 2007
- Partners: 7 states, 4 provinces; Observers: 5 states, 1 province
- Announced its design for a market-based, multi-sector cap-and-trade program, Sept 2008:
  - 15% CO₂ reduction below 2005 levels by 2020
  - Phase I to take effect Jan 2012

Midwest Greenhouse Gas Reduction Accord:
- Established November 2007
- Participants: 6 states, 1 province; Observers: 3 states, 1 province
- Preliminary design recommendations issued Dec 2008: 15 - 25% reductions by 2020, 60 - 80% by 2050

Regional Greenhouse Gas Initiative (RGGI):
- Compliance period began Jan 1, 2009
- Participants: 10 states
  Observers: 1 state, D.C., 3 provinces
- Market-based cap-and-trade effort to reduce power-sector CO₂ emissions.
- 10% CO₂ reduction by 2018 covers over 200 plants
- One allowance is the right to emit 1 ton of CO₂
- Annual RGGI cap is 188 million tons

Updated April 27, 2009

June 2009
Collaborative Greenhouse Gas Programs

National Energy and Environment Update:
- The EPA declared that CO2 endangers public welfare and human health.
- The White House’s Office of Management and Budget approved a proposal by the EPA to regulate GHGs under the Clean Air Act.
- President Obama’s proposed budget includes cap-and-trade revenue beginning in 2012.
- Congressmen Waxman and Markey released a draft Energy and Emissions bill March 31, which includes:
  - a GHG cap-and-trade plan to reduce emissions 20% below 2005 levels by 2020 through a multi-sector emissions trading program beginning in 2012
  - limits on the carbon content of motor fuel

RGGI’s Auction 3 held on March 18, 2009:
- RGGI states auctioned 2009 vintage allowances and the first 2012 control-period allowances, raising $117 million for energy efficiency, renewable energy, and other consumer-benefit programs in participating states.
- Participant states are: CT, DE, ME, MD, MA, NH, NJ, NY, RI, VT.
- Demand outstripped supply for both vintages. 50 entities bid 2.5 times the offered 31.5 million 2009 allowances, and 20 entities bid 2.3 times the available 2.2 million 2012 allowances.
- Compliance entities or affiliates (generators) were awarded the bulk of allowances:
  - 78% of 42 winners for 2009 allowances
  - 93% of 12 winners for 2012 allowances
- 2009 allowances cleared at $3.51 per allowance, 13¢ higher than Auction 2. Analysts posited that the expectation that RGGI allowances might have grandfathered value in a national cap-and-trade system may underpin the increased prices in each auction for 2009 allowances.
- 2012 allowances cleared at $3.05 per allowance. The 2.2 million allowances are 1.5% of the 2012 cap.
- The 4th and 5th RGGI auctions are scheduled for June 17th and September 9th.

Midwest Greenhouse Gas Regional Accord:
- Signed at Midwestern Governors Association Energy Summit to establish GHG reduction targets, Nov 2007:
  - Participants: IA, IL, KS, Manitoba, MI, MN, WI
  - Observers: IN, OH, Ontario, SD
- Preliminary Design Recommendations issued Dec 2008
  - Target reductions from 2005 levels: 15% - 25% reductions by 2020; 60% - 80% by 2050
  - Cap-and-trade should cover multiple sectors
  - Each jurisdiction to control allowance distribution methods
  - Final design pending results of further ICF modeling
- Model Rule anticipated by August 2009

Western Climate Initiative (WCI):
- Launched at Western Governors’ Association meeting to reduce regional GHG collectively, Feb 2007:
  - Partners: AZ, British Columbia, CA, Manitoba, MT, NM, Ontario, OR, Quebec, UT, WA
  - Observers: AK, CO, ID, KS, NV, Saskatchewan, WY
- Initial design released for a market-based, multi-sector cap-and-trade program (Sept 2008):
  - Phase I to take effect Jan 2012
  - Phase II to begin 2015; will cover 90% of regional emissions
- Released its 2009 – 2010 Work Plan, Feb 2009. Key WCI Committee tasks include:
  - develop emissions reporting database & allowance tracking system
  - develop rules for robust and transparent allowance and offset credit trading market
  - examine role of RECs in GHG accounting and treatment of voluntary renewable energy
  - update policy modeling; revise energy efficiency assumptions

* Earliest year an allowance may be applied against emissions.
**Brief Overview of the SO2 and NOx Emissions Markets**

The electric power industry is a major source of sulfur dioxide emissions (SO2) and nitrogen dioxide emissions (NOx) – both precursors of acid rain and smog. According to the Environmental Protection Agency’s (EPA) 2006 Acid Rain Progress Report, the power sector is responsible for 70% of SO2 emissions and 20% of NOx emissions. Currently US policy encourages reduction in SO2 and NOx emissions which can be achieved through a cap and trade program. This market based model also allows for relative flexibility in compliance options. An emitting source may choose pollution control technology such as add-on controls like flue gas desulfurization (FGD) for SO2 and selective catalytic reduction (SCR) for NOx, fuel switching, and/or participation in the respective cap and trade markets. The decision is primarily driven by the regulatory environment, fuel input type, the level of emission output, and compliance costs, the latter of which affects wholesale and retail prices.

**The Acid Rain Program**

http://www.epa.gov/airmarkets/progsregs/arp/index.html

EPA’s Acid Rain Program (ARP), established under the 1990 Clean Air Act Amendments, requires reductions of SO2 and NOx emissions from the electric power industry. The Acid Rain Program was the first cap and trade program implemented nationwide to reduce SO2 emissions.[1] The SO2 program set a permanent cap on the total amount of SO2 that can be emitted by fossil fuel-fired generating units and allows allowance trading so affected sources have some flexibility in their compliance method. Currently, SO2 sources must surrender one allowance to emit one ton of SO2. If a source falls short on the number of allowances it needs to comply with its individual cap, it can purchase allowances from another source that has a surplus of allowances. An emitting source may have a surplus of allowances for several reasons. For example, if it chose to install and/or run scrubbers, it can “bank” those unused allowances for future use or sell the leftover allowances to other emitting sources.

**The NOx Budget Trading Program**

http://www.epa.gov/airmarkets/cap-trade/docs/nox.pdf

In 2003, the cap-and-trade method was also implemented to reduce seasonal (primarily summer) NOx emissions from fossil fuel-fired plants. While the EPA administers the program, states are required to share the responsibility for allowance allocation and enforcement. Currently, NOx sources must surrender one allowance to emit one ton of NOx.

[1] The Acid Rain Program also required NOx emission reductions by select coal units but under a rate-based regulatory program [http://www.epa.gov/airmarkets/progsregs/arp/nox.html].
