P R O C E E D I N G S

(9:07 a.m.)

CHAIRMAN KELLIHER: Could I ask that the conversations come to a close, or you could take them out into the hallway? I think that's what they say in Congress.

Let me begin with some brief opening remarks, and then I'll ask my colleagues if they have some comments they want to make, and then we can turn to Staff to describe how the day will be structured, and then we can proceed with the panelists.

Today, the Commission holds a Technical Conference on the subject of Reforming our Open Access Transmission Rules. The purpose of our reform effort is very clear: It's to eliminate any opportunity to engage in undue discrimination or preference in transmission services.

And OATT reform, I have to acknowledge, is a top personal priority of mine, since I've been at the Commission and become Chairman.

Now, based on the initial comments we have received on the NOPR, the reform effort is also perceived as needed, by the industry. The Commission issued the OATT reform NOPR on May 19th of this year, and while not in complete agreement with every aspect of the NOPR, responses to our proposal and to the NOPR, have been largely positive.

And between the initial and the reply comments,

1 we have received 216 comments, totalling over 5,700 pages.
2 So we have a very extensive record to work from.

3 Now, through extensive outreach efforts, both
4 before the issuance of the NOPR and afterwards, and through
5 review of the comments, we've identified three main areas of
6 OATT reform that we think would benefit from further
7 discussions today.

8 Those three areas will be the subject of today's
9 technical conference, and they include: Transmission
10 planning, ATC calculation, and redispatch and conditional
11 firm service.

12 Now, speaking only for myself, I'm convinced that
13 we must provide for strong regional transmission planning,
14 and also act to assure greater consistency and transparency
15 in ATC calculation.

16 To me, the question is not whether we should act
17 in these areas, but exactly what form our actions should
18 take, and I hope that the Technical Conference will help
19 answer that question.

20 Now, with respect to redispatch and conditional
21 firm service, I start off with a preference for the NOPR
22 proposal favoring redispatch, however, I also see merit in
23 conditional firm service, and want to explore this option.

24 Now, in these areas, I acknowledge that I have an
25 open mind, and I look to the quality of the comments and the

1 presentations, and so I encourage the presenters on the
2 third panel, as well as the first and second panels, to be
3 as persuasive as possible.

4 Now, to allow all interested parties to express
5 their views regarding these topics, we will allow comments
6 to be filed with the Commission regarding the subjects
7 addressed at the Technical Conference today. Such comments,
8 in addition to panel members' prepared materials and
9 transcripts from this Technical Conference, will be
10 available on our E-Library system and our website,
11 www.ferc.gov, on the Calendar Page for this Conference.

12 And all these materials from the Technical
13 Conference, will help establish a record that will assist
14 the Commission in issuing a Final Rule in this proceeding.

15 Now, in gratitude for our panelists for helping
16 us today, we'll provide lunch for the panelists to thank
17 them for their participation in the Technical Conference and
18 in our OATT reform efforts.

19 I particularly want to commend the Staff for
20 their outstanding work on this effort. The performance of
21 the OATT Team has been superb, not only in preparation of
22 the NOPR, but in the outreach efforts, the review of the
23 extensive record, and in the organization of this Technical
24 Conference. I think your work reflects very well on the
25 quality and expertise of the Commission Staff.

1 I also look forward to hearing the views of the
2 panelists, but first I'd like to ask my colleagues if they
3 have any opening comments they would like to make before we
4 hear from the panelists.

5 COMMISSIONER KELLY: Thank you, Joe. I wanted to
6 compliment you on your leadership in OATT reform, and, as
7 many of you know, this was an issue that Joe championed,
8 actually, long before he became Chairman, not long after he
9 joined the Commission.

10 It's very valuable, and it's quite a high-
11 profile effort of the Commission today, thanks to Joe. I
12 just had a few comments to make.

13 First of all I wanted to thank all of you who are
14 here today. I know that you're very busy, and I appreciate
15 your taking your time to come here and talk to us
16 personally.

17 There is something that is significantly
18 different about hearing people and seeing each other face-
19 to-face. We read the comments, or we read most of the
20 comments or --

21 (Laughter.)

22 COMMISSIONER KELLY: Our Staff reads the
23 comments, and it's great to have all that paper on your
24 desks, but there's nothing like hearing from someone face-
25 to-face.

1 As I have read the comments and talked to people
2 around the country, the thing that has struck me, is that
3 when Order 888 was passed, the emphasis was on "open"
4 access. And today, it appears to be on open and adequate
5 access, and that's the theme that I hear, and that's also
6 reflected, to an extent, in the topics that we're covering
7 today -- transmission planning, ATC reform, redispatch, and
8 conditional firm.

9 And part of what we're looking at, is the -- a
10 part of what I'm looking at, is the best way to make full
11 use of our existing transmission grid, as well as looking at
12 ways to expand that grid, and I see that reflected in your
13 comments, as well.

14

15 Just one final point: It's been ten years since
16 we issued -- FERC issued Order 888, and it will probably be
17 ten years more before we undertake a big reform effort like
18 this. So I think that really underscores the importance of
19 this endeavor.

20 What we're looking at, is reforms that will
21 enable us and you to do the job that needs to be done for
22 this country, in having a more robust and open grid in the
23 next ten years. Thank you.

24 CHAIRMAN KELLIHER: Thank you, thanks for your
25 comments. Colleagues? Mark?

1 COMMISSIONER SPITZER: Thank you, Mr. Chairman.

2 I, too, want to express appreciation for your efforts.

3 I first read the document when I was in Arizona,
4 and we had a conversation, and certainly the Chair's efforts
5 on this important task, I think, have borne some fruit
6 immediately, by some consensus being reached.

7 There are thorny issues that remain, particularly
8 today where we are focusing on a few of them, and we hope to
9 achieve some degree of consensus, and if consensus can't be
10 reached, then with a better understanding of the issues, we
11 can ultimately make an informed and prudent and thoughtful
12 judgment.

13 I want to take just a moment -- my friend, Jim
14 Kerr, is here, and his status, both within North Carolina
15 and NARUC, is a testament to his public service. And I'm
16 very appreciative, Jim, of your efforts, and will intently
17 listen today.

18 The issue of open planning, which is our first
19 topic, is one that was very salient in the West, and it's
20 one of those issues where there are benefits beyond those
21 that meet the eye, initially.

22 We have planning sessions going back to the
23 beginning of my tenure in Arizona, and the degree to which
24 information was broadcast out into the community from these
25 joint meetings, among states, as well as among interested

1 parties, and to those who didn't typically participate in
2 proceedings before the Arizona Commission, made it much
3 easier down the road, to site transmission.

4 And, again, it's not intuitive, but the open
5 dialogue in the process was very valuable, and I'm hopeful
6 that that type of dialogue and open process today, will also
7 generate benefits. Thank you, Mr. Chairman, for your
8 efforts on this issue.

9 CHAIRMAN KELLIHER: Thank you. Bill?

10 COMMISSIONER MOELLER: I'll echo the earlier
11 comments, Mr. Chairman, and praise you for bringing this
12 issue up. This was such a monumental Order, ten years ago,
13 and it goes with my philosophy that when we make major
14 policy decisions at some time in the future, as in now, ten
15 years, we should go back and take a look at what's working,
16 what's not, and make changes. Thank you for doing this.

17 CHAIRMAN KELLIHER: Thank you. John?

18 COMMISSIONER WELLINGHOFF: Thank you, Joe. As
19 all my fellow Commissioners commended you, I'd like to
20 commend you, as well. This is a monumental effort, and the
21 more you dig into this NOPR, the more you see its potential
22 import. It has tremendous import overall.

23 And it fits right into my philosophy, as well,
24 and that is, you know, maximizing and improving the
25 efficiency of the electric infrastructure and its use and

1 operation. I think that's what we're really trying to
2 accomplish here, and it's something that is really near and
3 dear to me, going all the way back to 1983, when I, in
4 Nevada, wrote one of the first Integrated Resource Planning
5 Acts there, so I'm very interested in the planning aspect
6 here, very interested in how -- you know, in 1983, we had,
7 you know, markets that were just barely operating on a
8 wholesale level, and now markets are much more robust.

9 So, obviously, we need to look beyond just state
10 jurisdictions, as we did at that time in integrated resource
11 planning, and I think this NOPR does do that, and consider
12 how we can do then, ways to be considerate of state
13 jurisdictions' responsibilities, and their interests, as
14 well, and do that in a way that we can do it
15 collaboratively.

16 So I'm very interested in that. I also want to
17 commend the panel and thank you all for answering the
18 questions with respect to demand response that we put in
19 this particular workshop session.

20 It is one of the ways, I believe, that we can
21 improve the efficiency of the transmission system and its
22 operation, by integrating demand response in as an equal
23 partner, and I look forward to asking you more questions in
24 more depth about that, as well. Thank you.

25 CHAIRMAN KELLIHER: Great, thank you. Why don't

1 we turn to Staff now, to explain a little bit about the
2 structure of the Conference, and then we can hear from the
3 panelists.

4 MR. HEDBERG: Good morning, all. We'll be having
5 an open structure here this morning. Please feel free to
6 exit and reenter today's Conference, as necessary.

7 Please turn off all your cell phones and pagers.
8 Restrooms are located on either side of the Commission
9 meeting room at the end of the intersecting corridors, by
10 the elevators.

11 We have a very ambitious agenda for today's
12 Conference, so, panelists, please limit your opening remarks
13 to five minutes. We have a clock provided for you to see
14 how much time you have left, and I'll remind you when you
15 have a minute left to conclude your remarks. Thank you very
16 much.

17 If time permits, at the end of the day, after the
18 panelists have concluded, we will open the floor to comments
19 for audience members. Thank you very much.

20 CHAIRMAN KELLIHER: Let's turn to the first
21 panelist, Commissioner James Kerr, and I want to thank you
22 for joining us today and for helping us out. Jim?

23 MR. KERR: Thank you, Mr. Chairman. I'm Jim Kerr
24 with the North Carolina Commission, and also of NARUC, and
25 so here this morning representing -- wearing several

1 different hats and representing several different
2 perspectives.

3 The five-minute clock is intimidating to someone
4 from my neck of the woods. We talk slow and think slower, I
5 think, so Mr. Larcamp assures me he'll pull the plug on the
6 clock, if I get in danger.

7 (Laughter.)

8 MR. KERR: But I do want to, on behalf of NARUC,
9 officially welcome the three new members of the Commission,
10 and I want to begin my remarks this morning, by speaking
11 more generally beyond the terms of the NOPR, but to speak to
12 the working relationship that we believe exists, and comment
13 on the constructiveness of the working relationship that we
14 are thrilled exists between this federal agency and NARUC
15 and our member states and commissions.

16 When we look at our relationships with your
17 sister federal agencies, to be quite honest with you, we
18 hold this up as the model for how we ought to interact with
19 our federal colleagues.

20 We have had cooperative work on resource
21 procurement. We just announced or will announce shortly, a
22 working group on demand response, and, beyond that, just the
23 day-to-day communication.

24 You know, we recognize that, collectively, we
25 share responsibility and obligations over the provision of

1 what is an essential service to our economy and to the lives
2 of the citizens of the state, and we are appreciative that
3 the working relationship we have, is reflective of the
4 significant shared responsibility that we enjoy.

5 In this NOPR, we have filed formal comments,
6 reply comments. With respect to today, I have filed a
7 written statement. I should be clear that someone on my
8 behalf, has filed a written statement, as well as written
9 answers to the specific questions.

10 I want to begin briefly by just letting you know
11 that the written products that we file in these dockets, is
12 the product of an open, collaborative, transparent, working
13 group process within NARUC.

14 So we believe, as you believe, that such
15 characteristics are important to the production of good
16 work, be it transmission planning or written comments.

17 We go through -- since the NOI, we have formed
18 ourselves, within the Electricity Committee, into working
19 groups that are representative of different geographic
20 regions, different market structures, different retail
21 delivery structures.

22 They contain staff, both legal and technical
23 staff, and so the point I want to make is that I do believe
24 the work product that we file with you on not just planning,
25 but on all of these issues, really is a good reflection of,

1 you know, where we unanimously say, for instance, we are
2 strongly supportive of your efforts and planning, you can
3 take that to the bank.

4 I think there are places where we say to be
5 careful, be cautionary, and you can similarly, I think,
6 trust that that's a place that, collectively, states have
7 put their judgment together and sought to give you their
8 best advice in that regard.

9 So, I think that in our comments, you will see
10 strong support for the characteristics or the principles of
11 openness, for increased breadth, a broader view of the
12 planning process, transparency, and collaboration.

13 There is, however, advice, again, grounded in the
14 actual experience of the folks working on these comments,
15 the collective judgment of that group, that in certain
16 areas, the federal regulators should, we think, for good
17 reason, show deference and be restrained from being too
18 prescriptive.

19 I do want to be clear, though, that the calls for
20 deference are not made in a vacuum, nor are they calls to
21 maintain a status quo, but, rather, they are premised on the
22 belief that there will be processes which are open,
23 collaborative, inclusive. You know, you can run on with the
24 adjectives, but, I mean, where we say to be deferential, we
25 are presuming that there will be the type of planning

1 processes in the regions, to which you have spoken and to
2 which you have indicated an intent to require participation,
3 and so what our view is, is that if you have such a process,
4 then there are legitimate places that that process will
5 decide some of these questions, such as cost allocation,
6 such as the actual definition of "the region," whether or
7 not there's a need for an independent party to be involved.

8 So it is not to leave it with the transmission
9 owners to do the planning for themselves; it is to create
10 processes, and then there are some issues, once the types of
11 processes that we all agree on, exist, where there are
12 places that you should defer to those processes.

13 My time is up, and I'm barely getting going, so
14 let me just try to be very quick, and I will not go through
15 the summary of the written comments that we have.

16 I do want to talk briefly, if I can, about two
17 processes that are ongoing in the Southeast, and then I'll
18 answer whatever questions that you have.

19 There are two different processes you all -- and
20 we're appreciative that you acknowledged the North Carolina
21 Transmission Collaborative in the NOPR itself. There are a
22 couple of points about these, and I'll briefly describe
23 them.

24 Each of these efforts predated the NOI or the
25 NOPR. These were efforts that we, in our region, thought

1 were important to begin on our own.

2 And so this is not in reaction to your thoughts
3 on it, but, in fact, I think they were -- I hope your
4 thoughts were informed, as they were reflected in the NOPR,
5 by what you saw going on, and not just in the Southeast, but
6 certainly in the West and other regions within the RTOs, as
7 well.

8 In North Carolina, in particular, we have a
9 Transmission Planning Collaborative. You have put Mr.
10 Ingersoll beside me, who deals with this every day, so he
11 can handle the technical. I appreciate your putting him
12 beside me, so he can handle the technical questions, and so
13 I'll defer to him on this.

14 But let me summarize for you, why we've done what
15 we've done. We found ourselves -- this process was
16 initiated because we understood that there were significant
17 long-term transmission constraints.

18 The transmission-dependent utilities in our
19 region, were concerned regarding a lack of transparency in
20 transmission planning, and we at the State Commission, with
21 some encouragement from some members of our Congressional
22 Delegation and others who were interested in these issues,
23 we encouraged the parties to jointly address the situation
24 that we found.

25 Let me tell you briefly where we were and where

1 we are now. Prior to forming this Collaborative, we had
2 separate planning processes for both Duke and Progress.

3 We had separate models and assumptions; we had
4 limited collaboration or the sharing of ideas; we were
5 purely focused on reliability; we had little input from non-
6 transmission-owning stakeholders, and the OASIS system was
7 the only source of information.

8 Today, our process in North Carolina, can best be
9 described as having combined planning for both Duke and
10 Progress, combined models and assumptions; the TDUs have
11 access to all information, with equal voting rights for
12 transmission owners, as well as TDUs.

13 We have third-party oversight of the process; we
14 have a dual focus on both reliability, as well as access to
15 regional resources, and we have a method for participation
16 by all stakeholders.

17 In about two years, we've gone from, I think,
18 what we all concerned is inadequate, to what we believe is
19 significant improvement, and we've done it with a fairly
20 light hand. To be honest with you, we got them all in a
21 room and told them we thought this was important, and we
22 left them to figure out how to do it, and I think that's
23 supportive of some places where in this NOPR, you're being
24 encouraged to take a light touch.

25 Let me also briefly comment on a process that's

1 going on in SEARUC, across the ten-state regions. Chairman
2 Hochstetter of the Arkansas Commission, and I, frankly, in
3 conversations with Commissioner Kelliher, I think, before
4 the NOI was produced, had thoughtful discussions of
5 planning.

6 And I think Sandy and I shared an interest in
7 exploring this further. We, this Summer, dedicated our
8 annual meeting, the electricity portion of our agenda, to
9 two full days of meetings around what we could do -- what we
10 were doing, and what we might do better in the region.

11 We brought in from the Salt River Project, the
12 representative to WECC who is Rob -- and I can never
13 pronounce his last name, but I think you know -- John will
14 know who I'm talking about.

15 MR. KERR: And he worked with us, and we brought
16 Rob in because we wanted to avoid the initial reaction that,
17 oh, we can't do this in our region. We wanted someone to
18 come in, who had gone through and fought a lot of these
19 battles, and he's a real resource, and we were appreciative
20 of the Salt River Project making him available to us.

21 We had broad representation. We had EPSA, we had
22 renewable resources in the room, Rob Gramlich, formerly of
23 the FERC Staff, and we had the transmission owners, the
24 TDUs, and we spent two days.

25 We came up with kind of a list of principles.

1 They look much like yours. Somehow, we got to 12 instead of
2 eight, which, as long as I'm going over, you can see we have
3 a tendency maybe to be less brief --

4 (Laughter.)

5 MR. KERR: -- than you all, but we circulated
6 that to the group. We have a ListServe. We circulated
7 that. Progress Energy did a detailed critique. We
8 circulated their critique.

9 We then met this Summer in San Francisco during
10 the NARUC meetings, and argued about Progress's critique,
11 but we, I think, learned a lot from that. We had CAPX 2020
12 send a representative from the Midwest, to meet with us,
13 and, again, to give us a kind of we've done this, these are
14 the lessons learned approach.

15 We are in the process of drafting the strawman,
16 and the "we," here, is Chairman Hochstetter and myself, with
17 some help from other folks. We plan, in the next week or
18 so, to circulate it to the group.

19 I should also say that we have had support from
20 your Staff, senior Staff, here, who have been kept in the
21 loop, and have been available to us to share their thoughts.
22 And what we hope we will do, is come forward at some
23 appropriate time, with a resolution or something in support
24 of a strawman, which would, we hope, serve as a political
25 statement in the Southeast Region, that we, as the state

1 regulators, believe that this is something that should be
2 pursued.

3 I think, thankfully or conveniently, from our
4 standpoint, you know, your efforts here in this NOPR, will
5 come overtop of that from the federal level, and so that
6 what we would hope would happen, is that we would have kind
7 of a joint federal/state position that, in the Region, we
8 believe that there's value to be gained here.

9 So, I am six and a half minutes beyond my time
10 and so I will stop there and look forward to your questions.
11 Thank you.

12 CHAIRMAN KELLIHER: Thank you. I want to thank
13 you for your comments. That was very helpful and worth
14 every minute.

15 (Laughter.)

16 CHAIRMAN KELLIHER: But I want to warn the rest
17 of the panelists --

18 (Laughter.)

19 CHAIRMAN KELLIHER: -- that you will be held
20 strictly to the time limits.

21 MR. KERR: The Chairman needs to tell Mr.
22 Ingersoll that he can't have his five minutes.

23 (Laughter.)

24 CHAIRMAN KELLIHER: So, now, we'll hear --

25 MR. KERR: When you have them by the rates, their

1 hearts and minds follow.

2 (Laughter.)

3 CHAIRMAN KELLIHER: He was nodding a lot.

4 (Laughter.)

5 CHAIRMAN KELLIHER: We'll now hear from Mr. Verne
6 Ingersoll, Director of Regional Planning, System Planning,
7 an Operations Department of Progress Energy. Mr. Ingersoll?

8 MR. INGERSOLL: Thank you, Chairman Kelliher.
9 Good morning to you and the Commissioners and Staff.

10 Progress Energy greatly appreciates the
11 opportunity to be on this panel. I, myself, am an engineer,
12 and having to follow up discussions after Jim Kerr, that's a
13 tough route for an engineer to follow, but I'll do my best.

14 I do want to mention, before I start my regular
15 remarks, that we filed extensive comments in this
16 proceeding, and also the comments of EEI, we think, are very
17 good, and Progress is very supportive of the comments that
18 have been filed by EEI.

19 Progress Energy is a major transmission service
20 provider, with over 11,000 miles of transmission in Florida,
21 North Carolina, and South Carolina.

22 We have been providing reliable and economic
23 service to customers for over 100 years, so we've been at
24 this a little while.

25 Progress Energy strongly supports the NOPR

1 principles of openness, collaboration, and transparency in
2 the transmission planning process, and we strongly encourage
3 the Commission to issue flexible guidelines concerning the
4 development of collaborative and voluntary transmission
5 planning processes that adequately accommodate regional
6 differences.

7 Based on the experience, Progress Energy has
8 found that voluntary efforts that support collaborative
9 approach to transmission planning, are very beneficial in
10 the planning process. Jim mentioned some of those.

11 What we've been able to do, working with the
12 load-serving entities in our area, has been very helpful to
13 us, as well as to them.

14 The Commission, in Section 28.2 of the pro forma
15 OATT, in our opinion, really opened the door for what we're
16 doing in the Carolinas where directed transmission
17 providers, to include network customer load and their
18 transmission system planning, and to endeavor to construct
19 and place in service, sufficient transmission capacity to
20 deliver network customers, network resources to their load
21 on a comparable basis, to the transmission provider's own
22 resources.

23 You can't do that, if you don't talk to folks.
24 Moreover, the Energy Policy Act of 2005, further
25 strengthened the protection and priority of service for

1 load-serving entities.

2 In response to these directives, and in an
3 effort, as Jim mentioned, to meet the needs of our network
4 customers, Progress Energy is working to improve the
5 transmission planning processes in the areas in which we
6 operate.

7 In the Carolinas, we sponsored the establishment
8 of the North Carolina Planning Collaborative, which Jim
9 referred to. It's a little bit of a misnomer, in that the
10 Duke and Progress service territories span a good part of
11 South Carolina, so we really overlap. But it was the folks
12 of the North Carolina Commission who really got us all in
13 the room together and got us going.

14 But, also, in Florida, we supported the expanded
15 regional transmission planning process there. That is open
16 to stakeholders.

17 And in CERC, the CERC region, the transmission
18 planning process there, is being enhanced to provide a
19 broader participation of industry stakeholders and greater
20 interregional coordination.

21 You may or may not know that just recently, the
22 six regional reliability organizations in the Eastern
23 Interconnection, signed a Joint Reliability Coordination
24 Agreement. This Agreement provides a platform for
25 coordinated transmission studies going forward, across the

1 entire Eastern Interconnection.

2 These processes are providing network customers
3 and other stakeholders, with better information, greater
4 consistency in planning assumptions, and a platform for
5 planning innovation.

6 I'm a slow speaker, like Jim, so --

7 (Laughter.)

8 MR. INGERSOLL: I may have to skip some of this.
9 But on geographic scope, we feel that an effective regional
10 planning process should be of sufficient scale to allow
11 meaningful planning, but not so large as to become
12 cumbersome and inefficient.

13 In Florida, which is a relatively small region of
14 less than one full state, we have a process that expands the
15 entire region. But CERC is a huge, huge regional council,
16 and to try and do that all in one room, just is not
17 practical.

18 So variation needs to be allowed, and we feel it
19 would be best to leave this to the participants. They're
20 going to have to pay for it, they're going to have to make
21 it work.

22 We think they're in the best position to decide
23 what works for them.

24 On confidentiality, Progress believes that
25 protection of confidential material is critically important,

1 and detailed information cannot be put out in the public
2 domain, in many cases, without jeopardizing national
3 security and grid reliability, and distorting the
4 marketplace.

5 In addition, LSEs should not have to disclose
6 their competitive information to entities that may be their
7 potential power suppliers.

8 Through our experience, we've found that a two-
9 tiered approach to stakeholder participation, combined with
10 an appropriate confidentiality agreements, provide for an
11 open and transparent planning process, and, at the same
12 time, protects the confidentiality of information that you
13 need to have to assure compliance with the Standards of
14 Conduct.

15 On congestion studies, transmission congestion
16 can be analyzed in a large number of ways. There's not just
17 one way to do it.

18 DOE recently did one economic approach to it, and
19 there are others. For example, in the North Carolina
20 collaborative process, we provide for the study of an LSE's
21 generation resource alternatives and the study of
22 transmission customers' transmission expansion plans or
23 potential plans.

24 These studies convey the necessary information to
25 the LSEs and to other transmission customers, concerning

1 current and potential future grid congestion. This
2 information can then be used by the individual LSEs or other
3 transmission customers within their own planning processes,
4 to arrive at least-cost resources to meet their needs.

5 MR. HEDBERG: Mr. Ingersoll, you've exceeded your
6 five minutes. If you could please conclude your remarks?

7 MR. INGERSOLL: Let me just say that we think a
8 third party can be very useful. We have a third party in
9 our collaborative process, and in some cases regional
10 councils, as they do in Florida, can serve in that role.

11 But it must be recognized that the transmission
12 planning process is not an end in itself. The true measure
13 of an effective transmission planning process, is the
14 provision of a transmission infrastructure that provides for
15 reliable and economical delivery of electric energy to
16 customers.

17 We are proud in the Southeast that we have
18 achieved these objectives. The Southeast has a long history
19 of effective regional coordination of transmission plans and
20 in making transmission investments needed to ensure an
21 economic and reliable transmission system that supports the
22 economic growth and well being of the region.

23 This is an example: From 2001 through 2005,
24 transmission owners in CERC --

25 CHAIRMAN KELLIHER: I want to reassure you that

1 your statement is incorporated into the record, in full, so,
2 if you could really summarize, I'd appreciate it.

3 MR. INGERSOLL: I'll just say that -- let me just
4 close then, Mr. Chairman, by saying that over nine years,
5 CERC will have invested -- CERC companies will have invested
6 over \$11 billion in the transmission system by 2010, and we
7 think this is the real measure of an effective planning
8 process, getting transmission built. Thank you.

9 CHAIRMAN KELLIHER: Thank you. Just for the
10 purposes of all of the panelists, your statements are
11 incorporated into the record, in full. We've all seen them
12 in advance, and I think we've reviewed them in advance, so
13 you can really use the time as an opportunity to emphasize
14 or summarize.

15 With that, Ms. Johnson is the Director of
16 Transmission Asset Management for Excel Energy. We look
17 forward to your comments.

18 MS. JOHNSON: Thank you, Mr. Chairman and
19 Commissioners. My name is Sandra Johnson, and I am the
20 Director of Transmission Asset Management for Excel Energy
21 Services.

22 In my position, I oversee transmission planning
23 for the Excel Energy utility operating companies, which own
24 and operate approximately 17,500 miles of transmission
25 facilities in ten states.

1 We expect to invest nearly a billion dollars in
2 new transmission over the next three years.

3 I appreciate the opportunity to appear before the
4 Commission today to discuss FERC's proposed OATT reforms on
5 regional transmission planning. My comments today primarily
6 reflect the positions taken by Excel Energy in our initial
7 and reply comments submitted in this docket.

8 Excel Energy is a member of EEI, and we have
9 generally supported the positions that EEI has taken. On
10 behalf of EEI, I would like to note that EEI supports
11 greater regional and local coordinated transmission
12 planning.

13 EEI believes that the Commission's proposals to
14 require all utilities to develop coordinated planning
15 proposals, consistent with the NOPR, will, in many
16 instances, serve to formalize the widespread voluntary and
17 regional planning already established in much of the country
18 through RTOs and ISOs, as well as collaborative transmission
19 planning by non-RTO/ISO utilities.

20 Accordingly, EEI asks the Commission to recognize
21 and respect local and regional differences in establishing
22 principles for coordinated planning, and to provide
23 sufficient flexibility for the implementation of those
24 principles.

25 The remainder of my introductory oral comments,

1 reflect the views of Excel Energy. I will address only some
2 of the questions listed in the Technical Conference Notice.

3 My prepared written statement, which has been
4 submitted for the record, does address all the questions.

5 My comments today, as well as the positions
6 stated in our initial comments and reply comments, reflect
7 the fundamental characteristics of our service territory.

8 Excel Energy is one of the few utilities with
9 operations in three distinct regions in both the Eastern and
10 Western Interconnections. Northern States Power Companies
11 operate in the Midwest ISO; Southwestern Public Service
12 Company operates in the Southwest Power Pool; and Public
13 Service Company of Colorado, operates in the Western
14 Electricity Coordinating Council.

15 Historically, the practices in these three
16 regions, have been quite distinct. Because of these facts,
17 Excel Energy is quite supportive of the Commission's
18 proposed reforms taht improve transparency, reduce
19 ambiguity, and increase the consistency in transmission
20 planning.

21 Our views also reflect the fact that Excel Energy
22 operating companies, are both transmission owners and
23 significant transmission service users.

24 In response to the Commission's query on
25 appropriate geographic scope, Excel Energy supports the

1 geographic scope of regional planning consistent with broad
2 areas of interconnected operations like the WECC, Midwest
3 ISO, and SPP.

4 These geographic areas are large, however, the
5 organizations conducting the regional planning currently
6 have the core system and infrastructure knowledge to conduct
7 the regional plans.

8 The organizations should be able to implement
9 appropriate mechanisms to meet the Commission's eight
10 proposed guidelines.

11 Excel Energy believes subregional planning is
12 also critical and should not be subjected to a predetermined
13 geographic scope, such as a multistate or that geography
14 covered under a Section 215 regional entity.

15 Subregional processes should be given deference
16 to accommodate the needs or requirements of states or parties
17 that participate in such subregional processes.

18 Subregional processes may be initiated to comply
19 with state regulatory requirements, state resource planning,
20 or transmission planning obligations, reserve-sharing group
21 requirements, or agreement among the parties that
22 participate in such subregional initiatives.

23 These subregional plans can then be incorporated
24 into larger regional plans.

25 I would like -- actually, I'm going to skip that

1 one and I'm going to go right to the question regarding
2 demand response.

3 Excel Energy and its operating companies have
4 played a major role in advancing and relying on demand
5 response and demand-side management, to reduce the need for
6 new generation and associated transmission.

7 Currently, the Excel Energy utilities have nearly
8 1400 megawatts of controllable load, and 380 megawatts of --

9

10 MR. HEDBERG: Excuse me, Sandra. Please take one
11 minute to conclude your remarks. Thank you.

12 MS. JOHNSON: Sure.

13 Just to say, with respect to demand response, our
14 planning studies typically do use load forecasts that
15 account for the impact of demand response programs,
16 evaluating the reliability and integrity of the transmission
17 grid.

18 Public utilities with demand-response programs,
19 have and will continue to rely on demand response when
20 forecasting load for the transmission planning process.

21 Therefore, Excel Energy does not foresee that any
22 change in the OATT is necessary to address demand response
23 in the transmission planning process.

24 And with that, Excel Energy thanks the Commission
25 and their Staff for their leadership in continuing to

1 improve transparency in regional planning.

2 CHAIRMAN KELLIHER: Great. Thank you for your
3 statement. And now Mr. Jay Loock, the Director of Technical
4 Services of the Western Electricity Coordinating Council.

5 MR. LOOCK: Thank you, Mr. Chairman. It's a
6 great honor to be here with you and the Commissioners. We
7 appreciate this opportunity, and, actually, Rob Concioka --
8 that's how you pronounce his last name --

9 (Laughter.)

10 MR. LOOCK: -- asked me to be here. We were
11 hoping he could be here today, but he's asked me to fill in
12 for him, so just briefly -- and I think maybe I can get us
13 caught up on our schedule. I don't think I'm going to take
14 the five minutes, but as you know, WECC is the largest,
15 geographically, and the most diverse of all the regional
16 councils in NERC.

17 And WECC has had coordinated regional
18 transmission planning in the West for decades, and supports
19 the Commission's principles for coordinated open and
20 transparent transmission planning.

21 WECC has traditionally addressed and will
22 continue to address transmission planning from the
23 perspective of reliability of the Western Interconnection.

24 As the Commission is aware, WECC has expanded its
25 role to encompass new functions related to economic

1 transmission expansion planning.

2 In addition to revising the bylaws in 2004 to
3 remove language prohibiting the WECC from performing
4 transmission expansion planning studies, WECC has taken on
5 responsibility for managing an economic transmission
6 expansion planning database for the Western Interconnection.

7 WECC has also recently formed a new policy
8 committee under the WECC Board of Directors, and the name of
9 this Committee is the Transmission Expansion Planning Policy
10 Committee, or TEPPC.

11 Now, TEPPC's role is to guide and oversee the
12 WECC in responding to the need for regional economic
13 transmission planning and analysis.

14 WECC is focusing its expansion planning efforts
15 on providing impartial and reliable data, public process
16 leadership, and analytical tools. Of particular importance
17 with respect to the planning objectives the Commission has
18 identified in the NOPR, it is TEPPC's responsibility to
19 ensure that the WECC's economic transmission expansion
20 planning process is impartial, inclusive, transparent,
21 properly executed, and well communicated.

22 The planning process must, at a minimum, include
23 regional experts and stakeholders such as state and
24 provincial energy offices, regulators, resource and
25 transmission developers, load-serving entities, and

1 environmental and consumer advocates.

2 TEPPC is also responsible for organizing and
3 coordinating activities with subregional planning processes
4 in the Western Interconnection. And, with that, Mr.
5 Chairman, I conclude my remarks.

6 CHAIRMAN KELLIHER: Thank you very much. Next,
7 we'll hear from Mr. Peter Wybierala, Director, Transmission
8 Planning, NRG, on behalf of the Electric Power Supply
9 Association. Thank you.

10 MR. WYBIERALA: First of all, I want to thank the
11 Commission and the Electric Power Supply Association for
12 affording me the opportunity to speak at this Conference
13 today.

14 NRG Energy owns and operates about 25,000
15 megawatts of power plants in various RTOs, ISOs, PJM, New
16 York, New England, ERCOT, California, and also operates in
17 the State of Louisiana.

18 In addition, NRG has numerous development and
19 repowering activities going on in each of these states. As
20 such, NRG has a unique perspective of what I would
21 characterize as the good, the bad, and the ugly, when it
22 comes to discrimination and preference in the provision of
23 transmission service.

24 The specific topics that I'm going to address
25 here today, relate to the overall transmission planning

1 process. This includes such things as model development,
2 study procedures, geographic scope, frequency of conducting
3 studies, types of studies, economic and reliability
4 considerations, transmission congestion, and, finally, the
5 issue of independence.

6 Under model development, currently, power system
7 modeling by non-RTO IOUs, abounds with opportunities for
8 discrimination. Power system models are supposed to provide
9 at least some semblance of expected real-time operation.

10 The current models often have inaccurate system
11 topology representation; they lack special protection
12 schemes that transmission owners use for their own needs,
13 and special operating procedures that are in place to
14 mitigate system limits.

15 Also, the numerous assumptions and judgmental
16 calls that go into these models, particularly as it relates
17 to load representation and generation dispatches, is
18 problematic.

19 Typically, the transmission owner has many
20 generators throughout the system that can redispatch at will
21 to impact transmission availability over congested paths.
22 Likewise, the same is true for load forecasts.

23 The change in the assumption on peak temperature,
24 has a direct impact on system load, which, again, directly
25 affects transmission availability.

1 System line and transformer ratings are another
2 problem. Short-term ratings, in many instances, are not
3 available in the planning models, but are relied upon for
4 the real-time operation of the system.

5 These are just some examples of how a
6 transmission owner can manipulate the system models to
7 discriminate against other market participants in favor of
8 its own interests.

9 The next issue I would like to talk about, is
10 NERC versus the -- the NERC planning models, versus the OATT
11 models.

12 A new approach that I have recently seen to
13 discriminate, is to exploit the opportunity to post OATT
14 system models on the OASIS, that are different from the
15 transmission owners' representation and the regional NERC
16 planning models that ultimately become incorporated into the
17 Multiregional Modeling Working Group, also known as MMWG.

18 The process goes something like this: The
19 transmission owner adopts a budget horizon, let's say, of
20 three years, that's less than the five-year horizon required
21 by NERC.

22 The NERC models are supposed to have planned
23 system upgrades through, say, the five-year period. The
24 transmission owner conveniently leaves out the planned
25 system upgrades for years four and five from the OATT

1 models, on the basis that the upgrades are not officially
2 budgeted, and, therefore, it would be improper to sell
3 transmission service predicated on these upgrades.

4 This, in turn, causes base-case overloads in the
5 OATT models, which severely limits the availability of
6 transmission service, creates barriers to competition to
7 other market participants, without making substantial and
8 often cost-prohibitive system upgrades.

9 This is clearly discriminatory and prejudicial,
10 and it unfairly shifts the cost of planned system upgrades
11 to other market participants or indirectly affects denial of
12 service.

13 Requiring transmission owners to post OATT system
14 models that are consistent with the NERC models, would solve
15 this issue.

16 System studies: System studies should be
17 conducted at least annually and in a manner that addresses
18 the economic aspects of system expansion, in addition to
19 reliability.

20 It's not sufficient to only model a system
21 snapshot of the forecast peak load hour. NERC transmission
22 planning, N minus one criteria, under Note B, does not
23 require resolution of all base-case overloads by allowing
24 planned or controlled interruption of electric supply.

25 This can be exploited as a convenient way out to

1 avoid upgrading the system and leading to discrimination.
2 Hourly transmission constraint production costing --
3 quantify the cost of redispatch --

4 MR. HEDBERG: Excuse me, but please take one
5 minute to conclude your remarks.

6 MR. WYBIERALA: -- and unserved energy also
7 needs to be conducted to ensure that the transmission system
8 has expanded in a reliable and economic manner.

9 In general, base case overloads that cannot be
10 resolved through redispatch, should not exist in any system
11 model, unless it can be demonstrated that it's not
12 economical to upgrade the limiting facility, based on the
13 duration and risk of the load.

14 Transmission congestion and redispatch: Another
15 form of discrimination is the preclusion of market
16 participants from access to redispatch of the transmission
17 system owner's own generation.

18 Transmission availability and generation go hand-
19 in-hand. One cannot be evaluated, without considering the
20 other.

21 Operation requires the optimization of generation
22 and transmission over all projected load levels and
23 operational conditions.

24 Furthermore, market participants causing
25 transmission congestion in day-ahead or real-time, need to

1 pay equitably for the congestion that they cause, and with
2 that, I think I'll conclude my remarks, thank you.

3 CHAIRMAN KELLIHER: Thank you. I'd like to now
4 recognize Michael Kormos, the Senior Vice President of
5 Reliability Services, PJM Interconnection.

6 MR. KORMOS: Thank you, Commissioner, and thanks
7 for the opportunity to come down and talk about it.

8 I have provided written comments and answered the
9 eight questions explicitly, and what I really would like to
10 take the five minutes to do, is to discuss some of the
11 lessons learned, that PJM has experienced in our regional
12 planning process.

13 As you know, we've been doing regional planning
14 for about ten decades -- or, for about a decade, ten years -
15 -

16 (Laughter.)

17 MR. KORMOS: It feels like ten decades,
18 sometimes.

19 (Laughter.)

20 MR. KORMOS: We have learned a lot during that
21 time, and we've made a lot of changes, and we're actually in
22 the process of making even more changes as we speak.

23 I think that throughout that time, though, our
24 goals have been very consistent with what the Commission has
25 before it. We look at our process as being -- wanting to

1 be open, to be inclusive, and ultimately to ensure that the
2 development of the actual necessary infrastructure is done.

3 In order to do this, we've looked at a couple of
4 outcomes that we believe define success.

5 The first is having transparent processes, but I
6 would offer that transparent processes are not simply
7 putting a plan out at the end and having people look at the
8 plan.

9 I think they have to be involved in looking at the
10 assumptions, looking at the criteria, understanding how the
11 studies will be done, understanding how the solutions will
12 be developed, and, then, ultimately, how the plan will be
13 approved, and that will truly show a transparent process.

14 I also think there needs to be sufficient
15 information coming out of the plan, not only to allow the
16 participants to offer their own solutions and to participate
17 in that part of it, but to make their own business
18 decisions.

19 I think worked very hard to try to get the
20 information out in front, so whether it's generation
21 developers, demand-side developers, they have the
22 information to make their own business decisions in the
23 future years.

24 Obviously, all parties need to have the ability
25 to provide input, and, again, I would offer that that input

1 should be throughout the planning process, from the very
2 beginning when the assumptions are developed, to ultimately
3 when solutions are provided.

4 The last is that I also think it needs to be
5 flexible. We have had some experience, and when we
6 initially started, our main challenge was interconnecting
7 large amounts of generation within a very short time period.

8 The type of processes we put in place and the
9 types of analysis we did, I think, accomodated it very well,
10 but as the system has moved on, as the industry has changed
11 and we now face the need for additional backbone facilities,
12 we find ourselves really needing to change those processes
13 to look at different kinds of analysis. And I think that
14 that kind of flexibility is important.

15 I would like to share a couple of reasons why I
16 think PJM has been successful in developing the plan and
17 making these changes: The first is size. I do believe size
18 does matter.

19 I think bigger is better, but, really, from the
20 fact that you have more alternatives, you have more ability
21 to look at solutions over a larger geographic area.

22 We have multiple occurrences where we have made
23 enhancements in one transmission owner's system, to relieve
24 problems in a neighboring system's overloads, so I think
25 that's very important, and I think we should really look at

1 that.

2 I do believe we do need to respect historic flows
3 and natural market boundaries that occur.

4 I would also encourage coordination with
5 neighboring entities be mandated. I think that kind of
6 coordination also can give you the regional size that may be
7 needed, by making that effective.

8 Independence is another item that I think has
9 been something successful. I think issues with confidential
10 data, are definitely relieved with independence. We are able
11 to take a lot of confidential data that we have, put it
12 through our planning analysis, put it in our planning
13 models, ultimately put out aggregate results that don't
14 actually release any of that confidential information.

15 Independence has also allowed us to try to
16 balance short-term needs with long-term needs, and I think
17 that throughout the planning process, you're always caught
18 having to make those kinds of evaluations, and I think that
19 the independence helps in that area.

20 I would also hope that at the end of the day, an
21 independent process that is inclusive, will actually carry
22 some weight at the state commissions in the siting process,
23 as well.

24

25

1 MR. GESCHWIND: I believe we're on the right
2 track by mandating joint regional planning through the
3 tariff. We think that the right direction to go. We do
4 strongly believe, however, that the process needs to be both
5 collaborative and interactive. Joint planning means more
6 than just having the transmission owner, transmission
7 provider tell the participants on the system of their plan.
8 It needs to be a collaborative process. We also believe
9 that RTOs and those transmission owners in those RTOs should
10 not have a free pass from participating in that open and
11 collaborative process.

12 I'll stop there and look forward to talking more
13 in the question period.

14 CHAIRMAN KELLIHER: Thank you, Mr. Geschwind.

15 Our last panelist on this panel is Mr. Will Kaul,
16 Vice President for Transmission for Transmission for Great
17 River Energy. Thank you.

18 MR. GESCHWIND: Thank you, Mr. Chairman and
19 Commissioners for the opportunity to be here today.

20 I'm going to take a little bit different approach
21 than going through the questions and talk a little bit about
22 CAPX. It's been mentioned a couple of times. I'm the
23 chairman of that collaboration and I thought it might be
24 beneficial for some of the questions and issues before the
25 Commission to see what we're doing and what has made that

1 effort successful.

2 Two and a half years ago utilities in Minnesota,
3 several of us, got together and we anticipated the need to
4 make some major investments, both in generation and
5 transmission. Now we asked our planners to look out 15
6 years and give us some kind of a vision of what the
7 challenge was, and what we saw was 6300 megawatts of load
8 growth and about 8500 megawatts of new generation necessary
9 to meet that load growth. So we went about a process of
10 trying to determine what transmission was necessary to meet
11 those needs.

12 The group originally started with four utilities.
13 We now have 11 utilities. I think it's significant that
14 they're all vertically integrated utilities. We have
15 investor-owned utilities. We have cooperative GNTs and we
16 have municipal associations and so we have all of the
17 different kinds of utilities. We have many different
18 utilities serving us in Minnesota. So we got together and
19 we're at a point now with our first group of projects. We
20 call it Project Group One -- very original thinking there --
21 and it's 600 miles of 345 kV lines. It's about \$1.3
22 million of investment and all these projects are fully
23 subscribed by the participating utilities. In other words,
24 we have the willingness to invest in this expansion. The
25 Certificate of Need application to the State of Minnesota is

1 going to be filed in the next couple of months and so we're
2 on our way.

3 What I wanted to do is just touch on four things
4 that I think are important in making this work and starting
5 with our basic motivation as electric utilities we have an
6 obligation to serve and I think that's probably what got us
7 all together knowing that we needed to make these
8 investments. We also needed to do the planning for our own
9 due diligence as investors and owners and operators in the
10 system so that as you look at requirements for regional
11 planning I would hope that you would consider that basic
12 utility load-serving planning as the building block in any
13 regional transmission plan process.

14 The second point I want to make is that for us,
15 if you're talking about geography, economic, political and
16 historical factors were important in describing the
17 geography of our plans. Minnesota happens to be the local
18 economic engine in the region that we live in and we had
19 high population growth, high economic growth and also the
20 development of renewable energy resources. All those things
21 were drivers for us in doing this expansion and so that
22 helped describe our planning region. That's where the
23 growth was. That's where the transmission additions needed
24 to be.

25 We also had political factors and the political

1 factor I'm talking about here happens to be the political
2 boundaries of Minnesota. We're in jurisdiction. Most of
3 the regulatory activity is going to happen there. That also
4 helped describe our planning region, although it does spill
5 out into the neighboring states a little bit, but primarily
6 it's a Minnesota focus.

7 Then historical factors -- and there are several
8 here that come into play, but one is that the Minnesota
9 utilities that are involved in this have actually been
10 involved in joint planning for a long time, originally
11 through the map area and more recently as fellow MISO
12 members and as integrated utilities. Great River Energy,
13 for example has about 5000 miles of transmission, but we
14 don't have a system. They're a bunch of pieces and that's
15 because we're integrated with all our neighboring utilities.
16 So we have a history of joint planning, many interconnection
17 agreements, joint rate zones, et cetera.

18 Two other points quickly -- integration and
19 reconciliation of expansion plans within multiple planning
20 spheres was absolutely necessary. Most of us are MISO
21 members. MISO is looking at our plan and integrating it
22 into a larger regional plan. It's critically important.
23 It's also class by our project for purposes of revenue
24 recovery. That was what broke the log jam, frankly, for all
25 of us utilities to decide it was okay to invest because of

1 RECE. So that was very important.

2 We also participate in the state planning
3 process. That's also extremely important because the state
4 decides need and sighting and rate recovery. So bringing
5 those three spheres together was critically important.

6 Finally, last point and I'll get it real quickly,
7 regulatory certainty is the foundation for investment. It's
8 not new news, but we approached it a little bit differently.
9 We decided that regulatory reform should start at home. We
10 went to the state legislature. We got formula rates for the
11 investor-owned utilities. We got a streamline routing
12 process and we got the ability to form a TRANSCO if it's
13 deemed in the public interest. So things have all come
14 together and made this effort successful. Thank you.

15 CHAIRMAN KELLIHER: Thank you, Mr. Kaul.

16 Now we come to questions and have to say I have a
17 few questions, but I thought I'd refrain in favor of my
18 colleagues to begin with. I have to say I'm probably more
19 curious about the questions my new colleagues would ask than
20 the answer to some of my questions.

21 (Laughter.)

22 CHAIRMAN KELLIHER: But it's something Suedeen
23 and I have been working on for about a year and a half, and
24 I guess this the first opportunity for the new commissioners
25 to really engage in these issues.

1 I don't want to build up the anticipation for
2 your questions too high, but I'm curious about them.

3 (Laughter.)

4 CHAIRMAN KELLIHER: I also wanted to make sure
5 staff knew feel free to ask questions of your own. Don't
6 want until we exhaust every question that comes to mind
7 because I have to hazard that you're probably more familiar
8 with the 5700 pages of record than we are and that we need
9 the benefit of your knowledge. I also want to warn the
10 panelist that Commissioner Wellinghoff is very skilled at
11 cross-examination. So if he's really slicing into you,
12 don't take it personally. Just realize it's instinct or
13 habit for him.

14 So with that, do any of my colleagues have
15 questions or staff?

16 COMMISSIONER WELLINGHOFF: Thank you, Mr.
17 Chairman. I hope I can live up to that reputation, although
18 that is my background is cross-examination. So if I get a
19 little bit too edgy here, please back me off.

20 Let me start off with a few softballs for the
21 entire panel. Anybody can take these and my questions are
22 going to focus on Demand Response issue primarily, although
23 I do have some more specific questions for specific panel
24 members about the planning process, the regional planning
25 processes that you may now be engaged in. I'm interested in

1 exploring that some as well, but let me just start with some
2 general questions on Demand Response.

3 Can anybody give me their experience with Demand
4 Response as providing support to the transmission system
5 through reserves or other ancillary services? Does anybody
6 have experience with that?

7 MR. KORMOS: We have recently within the last
8 year filed to allow Demand Response and provide both
9 Spinning Reserves as well as regulation. We have had some
10 Demand Responders actually provide the Spinning Reserve
11 product and yet we have not had anybody on the regulation
12 side.

13 COMMISSIONER WELLINGHOFF: Let me follow up on
14 that with you, Mr. Kormos. Do you think that Demand
15 Response can provide support to the transmission system
16 through reserves or ancillary services?

17 MR. KORMOS: Absolutely.

18 COMMISSIONER WELLINGHOFF: Anybody else want to
19 comment on that question?

20 Yes, Mr. Ingersoll.

21 MR. INGERSOLL: We have pretty extensive
22 experience with Demand Response in the Carolinas and in
23 Florida, and we do have procedures in place to allow
24 interruptible loads that can be interrupted by the operator
25 to act as Spinning Reserve or Reserve. Let's just call it

1 Reserve, Operating Reserve and it can be effective depending
2 on the cost structure. Combustion turbines are not all that
3 expensive, so sometimes they're less expensive than Demand
4 Response. It depends.

5 As far as transmission, I think the DSM can be or
6 can reduce the load that you plan the transmission to serve
7 but caution has to be used and I've seen that differently in
8 different areas. If the operator doesn't have control over
9 the DSM or if there's no effective way to test what's out
10 there, it somewhat problematic to incorporate it.

11 COMMISSIONER WELLINGHOFF: So then to the extent
12 that DSM would be used for transmission planning, you would
13 recommend that there would have to be some assurance of
14 operator control?

15 MR. INGERSOLL: If you're going to rely on it to
16 build less transmission, you have to be sure that it can be
17 operated when it's needed and that can be contractual as
18 well as physical.

19 COMMISSIONER WELLINGHOFF: Would you also
20 recommend that there be fair value paid for that demand
21 response if it was operator-controlled?

22 MR. INGERSOLL: Certainly.

23 COMMISSIONER WELLINGHOFF: Another general
24 question on Demand Response. Does anybody see any barriers
25 to Demand Response other than what we talked about the

1 operator control issues? Are there any other barriers to it
2 providing support for the transmission system under the
3 OATT?

4 Mr. Kaul?

5 MR. KAUL: I'd just speak to our experience. In
6 our region we have a lot of Demand Response programs in
7 place and they're not dispatchable, which is important if
8 you want to plan for transmission needs, but one of the
9 barriers you might see is customer resistance. Because we
10 have a lot of Demand Response programs in place, people are
11 getting shut off already for various reasons because they've
12 entered into contractual arrangements. But these periods of
13 getting reduced are getting longer and longer each day and
14 so you might get some customer resistance to that.

15 COMMISSIONER WELLINGHOFF: I would imagine, Mr.
16 Kaul, that would depend upon the specific type of Demand
17 Response to extent that that Demand Response is, in fact,
18 the interruption of a system or process that's going to be
19 less tolerable by a customer.

20 MR. KAUL: Absolutely.

21 COMMISSIONER WELLINGHOFF: One final overall
22 question Demand Response. Does anybody see what options
23 there are for coordinating regions with different approaches
24 to real time economic dispatch? Does Demand Response play a
25 role in that?

1 Mr. Kormos is reaching for his mike.

2 MR. KORMOS: Obviously, I believe Demand Response
3 can play a role in real time economic dispatch. We allowed
4 Demand Response to actually put bids into the system. Those
5 bids came, in fact, at the marginal clearing price in the
6 region. I would see no reason why they shouldn't. I
7 absolutely believe they can and we're doing it today.

8 COMMISSIONER WELLINGHOFF: Thank you.

9 Some of the more specific questions I have,
10 starting with Ms. Johnson.

11 Ms. Johnson, in your prepared testimony and I
12 believe in your remarks as well -- your remarks this morning
13 because you addressed to me on response -- you indicated
14 that Xcel did not foresee any needed changes to the OATT
15 necessary to address Demand Response. Is that correct?

16 MS. JOHNSON: Correct.

17 COMMISSIONER WELLINGHOFF: You talked a little
18 bit about Xcel's evaluation to Demand Response in your
19 planning process. Could you tell me do you, in fact,
20 evaluate Demand Response to determine if accelerated Demand
21 Response can defer or delay transmission construction when
22 you do planning?

23 MS. JOHNSON: When we do our planning and we look
24 at our overall resource requirements, we take into
25 consideration any Demand Response. So if it is, in fact,

1 shaving off the peak load requirement, then we are, in
2 essence, not building transmission to accommodate that.

3 COMMISSIONER WELLINGHOFF: Right. But do you do
4 sensitivity to determine --

5 MS. JOHNSON: Yes.

6 COMMISSIONER WELLINGHOFF: You do with respect to
7 expanding Demand Response and how that may affect your
8 transmission needs?

9 MS. JOHNSON: Yes, we do.

10 COMMISSIONER WELLINGHOFF: Would that be
11 something you would think would be appropriate to specific
12 in regional planning?

13 MS. JOHNSON: I don't believe it would
14 necessarily would be required to be so specific about it. I
15 think most planning studies take into account various
16 sensitivities, which include an increase in overall demand.
17 So if it's a 10 percent increase or a 15 percent increase,
18 looking at the various sensitivities to a forecast at peak
19 load I think, in essence, already provides that.

20 COMMISSIONER WELLINGHOFF: Would you have any
21 objection to including that in the OATT?

22 MS. JOHNSON: No.

23 COMMISSIONER WELLINGHOFF: Thank you.

24 MR. DeJESUS: I wanted to jump in on this and I
25 think it's an echoing of what Mr. Kaul had said. We've had

1 on our distribution side pilot programs to defer upgrades in
2 order to -- based on Demand Response and the issue that
3 we've seen is not so much that customers don't want to be
4 interrupted, but that you don't have enough interruptible
5 load in places where you need to interact those kind of
6 programs to do that. So we do what we can. We find places
7 in the system that require upgrades and see what
8 interruptible loads are out there. We do it by contract.
9 But in terms of an ongoing obligation to do that on a wide
10 scale, I think the problem is finding a group of loads that
11 are -- customers that are willing to be interrupted at the
12 right times to accommodate the deferrals.

13 COMMISSIONER WELLINGHOFF: Might it also be a
14 problem of providing the right economic signals in the
15 market so such customers can aggregate themselves and
16 businesses can develop business plans, in essence, to
17 develop those kinds of resource?

18 MR. DeJESUS: Certainly.

19 COMMISSIONER WELLINGHOFF: Actually, I did have a
20 question for you, Mr. deJesus.

21 Since you answered one, let me go to that. When
22 you talked about the planning process having a broad look, I
23 assume then you would include efficiency, in essence.
24 Efficiency you list as one of the primary things, which is
25 one of the things that I'm interested in. So I'm obviously,

1 with respect to that efficiency, you would include Demand
2 Response in that subset as well.

3 MR. DeJESUS: Certainly. I mean we look at all
4 impacts on the system in order to determine what more is
5 needed and that would include Demand Response.

6 COMMISSIONER WELLINGHOFF: But from your
7 perspective, you're a transmission owner/operator, so you
8 don't really have any way to effect increasing Demand
9 Response, per say.

10 MR. DeJESUS: We do what we can. We participate
11 in the ISO programs that we belong to and on the
12 distribution side with our contact with retail customers.
13 We do go out and look for opportunities to exploit Demand
14 Response. Exploit is probably not the right word.

15 COMMISSIONER WELLINGHOFF: Thank you.

16 The next set of questions for Mr. Loock. Is that
17 how you pronounce your name, Loock?

18 I was interested in your map you had of your
19 western interconnect of subregional planning groups. It
20 looks like either nobody wanted Nevada or everybody wanted
21 Nevada.

22 (Laughter.)

23 COMMISSIONER WELLINGHOFF: They way it's
24 structured you've got how many groups overlapping southern
25 Nevada or is there really any overlap? Or is it just poorly

1 drawn?

2 MR. LOOCK: It's just poorly drawn. Yes, NTAC is
3 really over that area. Nevada has so much going on there,
4 especially in the Vegas area with generation. But for the
5 most part NTAC does have a little bit interest there and so
6 does SQAP, but mainly I would have to say between SQAP and
7 TAPs.

8 COMMISSIONER WELLINGHOFF: I was interested,
9 again, in your pre-filed material. Your transmission
10 expansion policy planning committee. How is that committee
11 constituted? Who is on the committee?

12 MR. LOOCK: There's 17 people on that committee.
13 We try to reach out to all stakeholders to be on that
14 committee. It would be environmentalists, regulators,
15 different people throughout the West that we feel like could
16 have -- and also the chair of each one of those subregions
17 that you see on your map are a part of that TPSI Committee.
18 And the idea is to increase communication between the
19 subregions. If there's policies that need to be developed
20 between these subregions, that's the forum we can do it in.

21 We have a monthly conference call between these
22 subregional planning groups so they can learn from each
23 other what's going good. What is not going so good. So we
24 feel like, also, that we develop a transmission database
25 that these subregional groups can also take advantage of

1 that and the models that are in there.

2 COMMISSIONER WELLINGHOFF: Again, I'm just trying
3 to understand. So the Committee is it just WEC board
4 members or does it stem beyond WEC board members?

5 MR. LOOCK: That's a good question. The
6 Committee itself, the TPSI Committee is just WEC members.
7 However, there's a technical advisory subcommittee that
8 reports to that committee that are WEC and non-WEC members.
9 We've invited and have done an outreach for everyone,
10 whether they belong to WEC or not to participate in that
11 technical advisory subcommittee and from there we've
12 developed work groups -- data collection work groups,
13 modeling work groups, studies work groups, which also
14 include WEC and non-WEC stakeholders.

15 COMMISSIONER WELLINGHOFF: But the Transmission
16 Committee is -- would you say it is representative of your
17 subregional planning groups?

18 MR. LOOCK: That's correct, yes. Just repeat
19 that we do have the chairs of each one of those subregional
20 planning groups on the TPSI Committee.

21 COMMISSIONER WELLINGHOFF: In the second page of
22 your statement, you indicated that WEC recommends that
23 congestion studies be based on cost production modeling to
24 be performed in the western interconnect on region-wide
25 basis every two years. Can you explain for me how that

1 production cost modeling accounts for Demand Response or if
2 it does?

3 MR. LOOCK: It can. I think in the database
4 we're putting together that we would include that
5 information in there and the reason why every two years is
6 we felt like due to resources that every two years we could
7 have, perhaps, a better model.

8 COMMISSIONER WELLINGHOFF: Let me go back. Does
9 it, in fact, include Demand Response when you do this
10 modeling?

11 MR. LOOCK: That's our plan, yes. As we put this
12 database together that is our plan is to include that.

13 COMMISSIONER WELLINGHOFF: Overall then, what do
14 you see as the role for Demand Response in transmission
15 planning?

16 MR. LOOCK: That's a good question. Overall, I
17 think there's a lot of programs out there. Programs which I
18 feel like the load-serving entity that has dispatch control
19 are comparable to like other resources. So I think it does
20 have and long-term planning does have a position. But I
21 think without dispatch control it's pretty hard to plan for.

22 COMMISSIONER WELLINGHOFF: I'm sorry. Without
23 dispatch control?

24 MR. LOOCK: Without dispatch controls, they're
25 pretty hard to plan for -- long-term planning.

1 COMMISSIONER WELLINGHOFF: So you also would
2 recommend that there be dispatch controls?

3 MR. LOOCK: Yes.

4 COMMISSIONER WELLINGHOFF: Do you know if there
5 are any such programs in the WEC?

6 MR. LOOCK: I don't know of all the programs in
7 WEC. I can assume there are some. I know the State of
8 California they very aggressively looking to implement some
9 plans.

10 COMMISSIONER WELLINGHOFF: Thank you.

11 Mr. Kormos, a few questions on your prepared
12 filed testimony. On page 4, in the middle of the page, you
13 talk about your backbone projects and indicate that the near
14 term estimated benefits from those projects to reduce
15 congestion is between 200 and 300 million a year. Is that
16 correct?

17 MR. KORMOS: Yes, sir.

18 COMMISSIONER WELLINGHOFF: Is it also correct
19 that this summer that AGM instituted Demand Response for one
20 week in August and determined that benefits were \$650
21 million?

22 MR. KORMOS: Yes, sir.

23 COMMISSIONER WELLINGHOFF: So from that, it just
24 looked like Demand Response may have the ability to, in
25 fact, exceed benefits of backbone transmission, in essence.

1 MR. KORMOS: I think one of the hardest things
2 here is being able to curtail the load at the very highest
3 priced hours. Obviously, you can see the implications.
4 Some of this congestion, though, unfortunately is probably
5 more spread throughout the year when prices are not quite as
6 high, but still there.

7 COMMISSIONER WELLINGHOFF: Did you look at, in
8 your modeling and planning, and considerations, whether or
9 not any of this transmission could have been deferred or
10 delayed through Demand Response?

11 MR. KORMOS: Yes, sir. We actually include
12 contractually obligated Demand Response is already included
13 in the planning process, plus density capacity credit as
14 well as defer reliability requirement is already -- we also
15 do it in the economic analysis. We also do look at the
16 voluntary Demand Response that we have on there and that
17 affect. We have just recently started publishing as well
18 the amount of Demand Response that would be required to
19 remove a particular congestion issue. We do it for
20 generation and Demand Response.

21 COMMISSIONER WELLINGHOFF: Tell me more about
22 that. That I wasn't aware of.

23 MR. KORMOS: As part of our economic efficiency,
24 and again, it's now filed with Commission. But we are
25 looking at -- actually, we have actually implemented,

1 although it hasn't been approved, publishing that kind of
2 information so people have to understand what the problem is
3 that they're seeing and the amount of generation that would
4 be needed, located in the areas that it help resolve the
5 congestion.

6 COMMISSIONER WELLINGHOFF: So you have that
7 available to anyone to look at to determine if you put so
8 much Demand Response in such an area it would reduce
9 congestion in this area and perhaps defer delay of
10 generation transmission.

11 MR. KORMOS: Yes, sir.

12 COMMISSIONER WELLINGHOFF: Is that available on
13 your website?

14 MR. KORMOS: It's on our Transmission Advisory
15 Expansion Committee, which is on our website?

16 COMMISSIONER WELLINGHOFF: Thank you.

17 COMMISSIONER KELLY: I have a follow-up question.
18 Is there a dollar amount associated with that? Do you value
19 it as well?

20 MR. KORMOS: We have not completed the economic
21 analysis piece of it. That's actually what's in front of
22 the Commission now and we're starting those studies. Right
23 now we put it out at a quantity amount. How much megawatts
24 of Demand Response would be needed. The economic
25 efficiencies, though, there are sensitivities that we'll

1 look at to sensitivities and the changes in congestion based
2 on Demand Response being one of the sensitivities we'll
3 looked at.

4 COMMISSIONER KELLY: When you try to value it,
5 what will you use? Is LMP important in that?

6 MR. KORMOS: For us, it's absolutely important.

7 COMMISSIONER WELLINGHOFF: Mr. Kormos, following
8 up on a couple of other things I've got. With respect to
9 your discussion on page 13 of your direct testimony that
10 discusses how critical it is to incorporate and enable
11 states to share information with respect to planning, and
12 you discussed earlier in your testimony your TAC Committee.
13 How does that committee interface with state jurisdictions
14 and how do they do, in fact, what you're recommending and
15 that is incorporate state interest?

16 MR. KORMOS: That is the process again where we
17 put out information and one of the things we're doing
18 working throughout is making sure that the information that
19 is being made available through that process, throughout the
20 planning process is what the states needs ultimately to make
21 their decisions. So we've encouraged them. For the most
22 part, all the states are active participants in the
23 Transmission Advisory Expansion Council providing their
24 input as well as receiving the information and we believe
25 that will ultimately be helpful in getting the transmission

1 sited if it needs to be.

2 COMMISSIONER WELLINGHOFF: Just so I understand
3 it then, so there are members of OPSI that are members of
4 TAC. Is that correct?

5 MR. KORMOS: Yes, the Transmission Advisory is
6 actually an open meeting. Everybody is invited.

7 COMMISSIONER WELLINGHOFF: I see.

8 MR. KORMOS: Actually, the FERC staff has come to
9 our Transmission Advisory meetings.

10 COMMISSIONER WELLINGHOFF: So it's not a selected
11 committee?

12 MR. KORMOS: No, sir. They are wide open
13 meetings. All the information is public beforehand and then
14 comments are -- we actually now provide the opportunity for
15 all parties to provide us written comments after the
16 meetings. Those comments are then shared with our
17 independent board regarding the issues that have been
18 brought up.

19 COMMISSIONER WELLINGHOFF: I appreciate that
20 clarification. Thank you.

21 Now going to pages 18 and 19, your specific
22 answer to our Demand Response question, and I certainly
23 appreciate your comments there regarding your indication
24 that you believe Demand Response resources have the
25 potential impact planning outcomes significantly and I

1 certainly would agree. And that you do believe it plays an
2 important role in the regional planning process. I'd like
3 to explore a little bit on the next page, 19, some of your
4 specific concerns, however, regarding Demand Response.

5 You indicate that to, in fact, rely on it in
6 planning that it may be necessary to have potentially large
7 liquidated damages provisions. Could you explain that a
8 little bit?

9 MR. KORMOS: We do not have any operational
10 control and so in most parts all of the Demand Response that
11 we would look for to solve a reliability issue would be
12 contractual obligations. And one of the issues that we have
13 right now is even our contractual obligations are only year-
14 to-year. So while somebody may have agreed to do it this
15 year, they can opt out in the following year. There is no
16 contractual obligation for them to stay in for the long
17 term.

18 If you're using that to plan and defer a
19 reliability upgrade five years in the future, one of the
20 biggest things we've seen is also congestion is just a
21 precursor to a reliability problem. So typically, if you're
22 going to see a reliability problem, you'll see a lot of
23 congestion beforehand. You also may then exercise Demand
24 Response a lot. We've had experience in the past that when
25 you've done that, they then choose to no longer participate.

1 The economics just are not there for them any more, whatever
2 business case they developed. So I think that's what we're
3 trying to weigh is how do then do we count on and ensure for
4 reliability perspective -- I think economics you have a lot
5 more flexibility, but from a reliability perspective when
6 you're looking at things that may have very long lead time
7 to get constructed. For us the backbone facilities are
8 maybe 8 to 12 years to get something built and how much
9 certainty and what do we need to put that kind of certainty
10 in place that we know that we can, in fact, count on the
11 Demand Response being there. So obviously, we're not
12 manually creating Demand Response in the future.

13 COMMISSIONER WELLINGHOFF: So you're saying you
14 need a utility quality resource, in essence, to rely on for
15 planning purposes.

16 MR. KORMOS: Yes.

17 COMMISSIONER WELLINGHOFF: Could you set up a
18 list of parameters for the Demand Response industry to tell
19 them what you need to make sure that, in fact, they could be
20 used for reliability planning purposes?

21 MR. KORMOS: No. And I think that's one of the
22 things we're working through with some of our mini-groups
23 that we have as to look at how we put those kinds of
24 parameters in place such that that certainty exist in the
25 future.

1 COMMISSIONER WELLINGHOFF: If those parameters
2 were in place, would you then need these kind of liquidated
3 damages provisions?

4 MR. KORMOS: Probably not.

5 COMMISSIONER WELLINGHOFF: Because you don't use
6 liquidated damages now for your generators I assume?

7 MR. KORMOS: In some cases we do. I mean there
8 are certain penalties that generators can, in fact, incur if
9 they don't perform. But I mean I wouldn't consider them
10 extreme.

11 COMMISSIONER WELLINGHOFF: You talk about having
12 these contracts in place and so forth and these parameters.
13 Do you offer today any such type of product to the Demand
14 Response industry?

15 MR. KORMOS: Yes. We have an ELM Program, which
16 again requires that they interrupt at least 10 times at our
17 request. There are penalties in place if they do not
18 interrupt during those times. It is a measured reduction.
19 They receive a capacity credit for that against their
20 obligation so that there's a financial ramification for
21 them, a positive one.

22 COMMISSIONER WELLINGHOFF: Do you see that
23 product as sort of essential mix of products that you think
24 is important with respect to transmission planning overall?

25 MR. KORMOS: I think that product, from the

1 reliability perspective, is essential because that is what
2 gives us some certainty and we have history with that that
3 they're there. But at the same time we have a large number
4 of voluntary products that we do, in fact, get very good
5 response from, as Ms. Summers said. That is going into the
6 economic planning and I think the real big issue -- and it's
7 not just with demand side -- we have it on the generation
8 side is really when you're looking out 15 years what
9 assumptions should we be making? We have the same issues on
10 generation. We have no control over generation deciding to
11 retire or new generation siting. So how we look at the mix
12 between generation and demand side I think they share a very
13 common problem.

14 COMMISSIONER WELLINGHOFF: Certainly, generation
15 could decide its uneconomic for release.

16 MR. KORMOS: Yes.

17 COMMISSIONER WELLINGHOFF: I'd like to go to Mr.
18 Kaul.

19 Your written statement that you submitted, the
20 very last page of that talks about the impact of DSM on
21 planning. In your very last sentence there you say, "Unless
22 DM programs are dispatchable for transmission purposes,
23 planners must assume they are building for system peaks." I
24 wasn't quite clear, if you could explain that for me.

25 MR. KAUL: I think it's basically what we've been

1 hearing here today, which is if you can't control that load
2 for transmission purposes, then you have to assume that you
3 have to build to serve the peaks.

4 COMMISSIONER WELLINGHOFF: Thank you.

5 Mr. Chairman, I have no further questions at this
6 time. Thank you.

7 CHAIRMAN KELLIHER: Thank you, Commissioner
8 Wellinghoff, gentlemen, lady.

9 Marc?

10 COMMISSIONER SPITZER: I'm interested in joint
11 ownership of transmission having seen first-hand some
12 successes. I know a lot of parties opined on the
13 jurisdictional issue and the flash point is the mandatory
14 versus voluntary aspects. We have the benefit of having
15 some engineers on this panel as opposed to lawyers, which is
16 wonderful. So having read and certainly feel free to
17 comment on the jurisdictional issue, but with regard to
18 economic or engineering or structural impediments to or
19 arguments in support of, I'd like to hear from the whole
20 panel on the concept of joint ownership and the mandatory
21 nature of that undertaking.

22 MR. DeJESUS: I know you're asking for engineers
23 and I'm the lawyer on the panel.

24 (Laughter.)

25 COMMISSIONER SPITZER: You could

1 practice engineering without a license and the engineers can
2 feel free to practice law.

3 (Laughter.)

4 MR. DeJESUS: We've had great success with joint
5 ownership program on a voluntary basis. One of the big
6 issues that you're going to have to deal with is that the
7 country really needs infrastructure and right away. These
8 joint ownership arrangements take a long time to negotiate.
9 We've got a facility that interconnects New England with
10 Quebec that took several years just in the contracting stage
11 and then you had to get to the studying of the facility and
12 the impact on New England and over the life of a contract
13 there's also the issue of commitment. You have a contract,
14 but when the economics of the deal change -- and they will
15 over time -- various parties will want to renegotiate and
16 that's fine if it were just a pure economic transaction, but
17 these facilities become part of the system and it's hard to
18 just shut down a project when the joint ownership
19 arrangement is done. So I think those are some of the
20 considerations you need to think about when you start
21 mandating joint ownership is that it's real delay and
22 potential for deals to unwind.

23 The last thing I wanted to note is that one of
24 the things that National Grid has been arguing is that the
25 transmission grid in the United States is very fragmented --

1 over 400 transmission-owning entities -- and that impacts
2 planning because now you have to create these government
3 structures that allow us to all get in the same room. You
4 don't have the efficient ability to make asset investment
5 decisions while you're planning the system. Joint ownership
6 arrangements, especially if they're mandatory would
7 perpetuate that fragmentation because now you're talking
8 about ownership arrangements on a project-by-project basis,
9 not looking at the system as a whole. So don't get me
10 wrong. We support joint ownership when it makes sense, but
11 a mandate would be a step back from where we're trying to
12 head, especially under EPAC.

13 MR. GESCHWIND: From a TDU perspective, we
14 strongly support the concept of joint ownership and believe
15 that the users of the system should have the opportunity to
16 invest in the system and graduate away from renter status to
17 owner status through this opportunity to invest. We've had
18 some, I think, success in our region with joint ownership.
19 My company owns approximately \$100 million worth of
20 transmission facilities. Again, even though I think we look
21 a lot like a TDU, we've had the benefit of agreements that
22 have allowed us to invest with our transmission provider in
23 the facilities of the region and not unlike Great River
24 Energy, you can't point to the SEMPA transmission system
25 that's represented by that \$100 million investment. It's

1 scattered pieces of investment located among four or five
2 different transmission systems.

3 One of the ways that we benefitted from that is
4 through facilities credits that we have been able to receive
5 in recognition for those investments. Unfortunately, within
6 the TAPs ranks there's probably lots of stories of utilities
7 that would like to become owners in the system and have been
8 frustrated in their efforts to achieve that. In the CAPX
9 process that we're still going through and we talk a lot
10 about CAPX as if it's a raging success. I think so far so
11 good, but we're not done yet. The process there allowed all
12 of the participants in the overall CAPX effort to bring to
13 the table, and we literally had a meeting where we sat down
14 and we had identified \$1.3 billion worth of transmission
15 projects that were on this Group One list and we sat down
16 and said here's what I'm in for. Here's what I'm in for and
17 we looked at which projects were subscribed and which were
18 not. There were some shuffling and back room discussions
19 and we ultimately ended up with these projects that were
20 fully subscribed from a capital investment perspective and
21 fortunately that ownership opportunity went beyond just
22 investing utilities and went all the way down to individual
23 municipal utilities.

24 In order for us to get to that point, though, one
25 of the keys was that we had worked through or at least we

1 think we have a good handle on how the cost recovery portion
2 of that -- I think the willingness of at least my company
3 and others to step up and say we will invest X millions of
4 dollars in the system part of that or a large part of that
5 was due, in fact, to the MISO Attachment O and the RECV
6 process. In that particular case, having this regional cost
7 allocation and the ability to spread the cost for large
8 projects beyond an individual system or an individual system
9 and its neighbor I think was key to breaking the stalemate
10 that Will Kaul mentioned that we were starting to see within
11 our CAPX process.

12 And if it's not, I think for systems that don't
13 have access to ITOs or the MISO Attachment O or other
14 processes, I think that there are some other reforms that
15 the TAPs has proposed to Section 30.9 of the tariff that I
16 think go a long way towards recognizing fairly the value of
17 investments in infrastructure that all of the parties bring
18 to the network, not just the network provider.

19 COMMISSIONER SPITZER: Well, playing devil's
20 advocate, how do you respond to Mr. deJesus concern that as
21 economics change over time the joint ownership format
22 actually becomes unwieldy and more difficult?

23 MR. GESCHWIND: We have not experienced that. In
24 our case I don't think that's a concern that should stop the
25 Commission from allowing for opportunities for joint

1 investment.

2 MR. DeJESUS: I mean I would just say just like
3 any other transactions there are good deals and bad deals.
4 You don't want to be forced into the bad deals and you want
5 to allow for negotiations so that folks can get into the
6 good deals.

7 MR. INGERSOLL: I agree with both. There is a
8 large jointly owned transmission system, the Georgia
9 Transmission System, and I'll attest to the fact that it is
10 extremely complex, although we don't serve that area. But
11 the contracts and the relationships to do jointly-owned
12 transmission are very complex and I think you need to factor
13 that into your thinking. It's not an easy thing and as you
14 go forward there are many, many factors to deal with. If a
15 system has to be upgraded, now you're back into a
16 contractual negotiation again if that particular facility
17 requires upgrading. So at least I think in our area in
18 general the transmission providers are willing and able to
19 build the necessary transmission.

20 I think that there are situations where jointly-
21 owned transmission can be helpful, particularly where
22 there's a large transmission facility possibly associated
23 with a remote generator that needs to be built to serve
24 multiple parties. That can be very helpful to jointly build
25 such a facility. But I think it's hard for us to see a

1 progress on a requirement hold an open season and slow down
2 the process of getting transmission built would be overall a
3 benefit. That it would create more complexity and more
4 delay.

5 MR. KERR: Commissioner, let me just jump in and
6 reference the CAPX, the comments earlier from CAPX about the
7 legislative changes that they identified through the process
8 and then were able to go find solutions for and one of the
9 concerns, I think -- and speaking more from an southeastern
10 commissioner -- but I mean the comments are we don't think
11 you ought to mandate joint projects. I think in addition to
12 the contractual complexity there are likely legal
13 complexities. Those with respect to cost allocation and
14 jurisdictional issues, even at the local and state level.
15 There are also opportunities. Similarly the different types
16 of entities you might have in a project provides probably
17 some financing opportunities, cost of borrowing advantages
18 and so forth. But it seems to me that mandating potential
19 solutions in the context or at the outset of really trying
20 to develop comprehensive planning processes runs the risk of
21 overly burdening the process at this stage.

22 They way we've talked about joint ownership in
23 the North Carolina process has been let's get comfortable
24 with the quality, the optimization of the planning. Let's
25 identify what those problems are, then lets' look at what

1 the potential solutions are, the options and understanding,
2 like in CAPX, we may need to go in and tweak state statutes
3 to address the timing of recovery for the regulated
4 companies versus others. So my point is just simply to say
5 I would be a little bit weary of overburdening the quality
6 of the planning process of such a mandate versus let's
7 improve and at some point down the road when we feel good or
8 have improved the ability to identify problems. This fits
9 into the kind of solution category to be worked out by the
10 parties or where us regulators need to get involved or
11 legislatures. That's part of it as well.

12 COMMISSIONER SPITZER: Commissioner, one facet of
13 the regional issue is in lesser jurisdictions where the
14 presence of public power you have the opportunity for tax
15 exempt public financing, so you save a couple hundred bases
16 points and that's were major benefits -- it may not be
17 universally available, but I know in some areas, entities
18 were formed to take advantage of the public, either tax
19 increment financing or tax exempt financing.

20 MR. KERR: Right. And it can work. We've done
21 this on generation in the '70s, the joint action agencies.
22 I mean it is as much an opportunity. I think for purposes
23 of why we're here today it seems to me it's a bit of a
24 timing issue about the planning process versus kind of
25 skipping ahead or burdening it too early with possible

1 solutions would be my take on it.

2 COMMISSIONER SPITZER: Please.

3 MS. JOHNSON: Xcel Energy has a lot of experience
4 with jointly-owned projects with a significant amount of
5 transmission in the West. In Colorado where we have that
6 joint ownership. And albeit, some of those contracts are
7 very complicated, they're also very successful. And through
8 our regional planning efforts, we continue to explore joint
9 ownership possibilities. Xcel believes that it should
10 continue to be voluntary and not mandatory. And as
11 Commissioner Kaul said, it can be overly burdensome in the
12 onset of a project just as a prescribed open season could
13 be.

14 We believe that the focus of an open season is
15 really to right size a project and ensure that you have the
16 inputs of all the various stakeholders as you go forward and
17 build a project. Much of what determines, in terms of the
18 economics and who participates ultimately, is the economics
19 and that costs assurity that Mr. Kaul also spoke in
20 Minnesota. We're also seeking the same type of cost
21 assurity in our recovery from the State of Colorado as well
22 as Texas to make these investments. And I'd also like to
23 say that ownership does not imply usage rights. It implies
24 an opportunity for transmission service revenue.

25 MR. KORMOS: I probably offer just ones that are

1 practical just sort as an independent planner. I think one
2 thing that would be important, though, I wouldn't want to
3 lose the contractual obligation to build, which we have. I
4 mean we know who is obligated to build and I would not want
5 cloud that with a process like this and I'm thinking I'd be
6 very cautious about that.

7 The other concern I have is just from a
8 practical. I'm not sure how we would pick the winner. I'm
9 not sure right now even if we have two transmission owners
10 who want to build the same project how we decide which one
11 should build. That's going to be a very real issue for us
12 that we need to deal with, let alone if we started to get
13 into joint ownership models and financing models and how we
14 would ultimately evaluate that. So just from a practical
15 state, I would caution against. I'm not sure of the
16 criteria we could even to evaluate these kinds of proposals.

17 MR. GESCHWIND: I've just got one final comment.
18 I think it would be a great problem to have to have to
19 figure out which transmission owner would build a project
20 because you've got more interest in building a project than
21 projects available. That is not the experience where we
22 come from. I think it's just the opposite and I think the
23 joint ownership opportunities that we have, I think, were
24 the impetus to get some of these projects going forward and
25 that now we have a chance to bring the stakeholders and the

1 users of the system together to put some skin into the game.
2 And absent that, I think some of these projects that we need
3 going forward are almost too large for individual companies
4 to step up and take on by themselves.

5 MR. KAUL: Just a quick couple of comments. One
6 is on these joint ownership agreements. Yes, they're
7 complex, but they're very manageable. We've been doing
8 that for years and years.

9 The second thing is on the mandate, at least I
10 think from the CAPX point of view, we have sort of a
11 delicate thing and harmonic convergence and it all seemed to
12 work somehow and we wouldn't want anything to happen that
13 would upset that.

14 COMMISSIONER SPITZER: Harmonic convergence.
15 That's a new one.

16 (Laughter.)

17 COMMISSIONER SPITZER: Anything else on that?

18 MR. WYBIERALA: Yes, I'll just make one comment
19 from a generator's perspective and we don't normally
20 consider ourselves in terms of transmission thinking that
21 way of developing transmission. We also have issues related
22 to if we had transmission there's a tariff issue there. But
23 if it made sense from a generation perspective to jointly
24 participate in transmission, I think we would welcome an
25 opportunity to do that and evaluate the benefits of that

1 investment.

2 COMMISSIONER SPITZER: Mr. Kormos identified the
3 obligation to build and that's been a historic state issue
4 and obviously is a flash point with regard to federal
5 jurisdiction, but as the NOPR has evolved, we now have the
6 overhang of reliability and particularly with regard to
7 interstate and you've got this circumstance where you could
8 have a penalty, ultimately potential for substantial
9 penalties. There are jurisdictional limits on a federal
10 mandate, but I've been reflecting on overhang of reliability
11 with regard to interstate and I'd like you to discuss how
12 you see the interrelationship between reliability and
13 potential -- whether it comes out of the reliability focus
14 or this proceeding -- issues having to do mandatory
15 obligation to build coming from outside what has been the
16 generally recognized role of purely intrastate procedures.

17 MR. DeJESUS: Commissioner, we have an obligation
18 to build as well in New England. It was voluntarily entered
19 into, but it's been very -- well, it's served us well. I
20 mean a lot of folks think that the obligation to build is --
21 we come up with a plan, list all the projects and now the
22 TO has to build those projects in the way that plan, that
23 particular plan is laid out and that's not how it works.
24 Planning is an evolutionary process. From year to year,
25 things change and as you get to the point where you actually

1 start building, you look at things a little bit more
2 closely.

3 One of the things that transmission owners get
4 from a -- and we like to use the word "commitment to build,
5 commitment obligation." I'm not exactly sure if there's a
6 difference. You get to specify the terms under which you
7 would build. In New England we have in our transmission
8 operating agreement a provision that lays out transmission
9 owner obligations, ISO obligations to fulfill what's in the
10 plan. Those things include the ability to recover your
11 costs. What happens if you don't get siting approval? And
12 so if we can get to that level of detail with this
13 commitment to build, it actually is a useful thing from a
14 transmission owner's perspective.

15 And also I want to get to your reliability point
16 and that's this. Now we don't think that planning should be
17 exclusively reliability driven and we wouldn't hang our hook
18 on the commitment build on just the reliability obligations
19 that we have. We think we have a broader responsibility to
20 our customers to ensure things like congestion reduction and
21 that commitment to build would extend to that as well.

22 COMMISSIONER SPITZER: I understand that you've
23 got a scheme that embraces more than simply reliability and
24 you want that paradigm to be broader, but I guess my point
25 is perhaps the reliability issue can invoke certain changes

1 in what might be limited commitment to build.

2 MR. DeJESUS: And I think that helps, but I mean
3 let's face it, if the plan were truly a collaborative
4 process and the transmission owner sanctioned the plan as
5 well, then you wouldn't have any problem getting a
6 transmission owner to agree to build what's in the plan. I
7 think that's fairly simple. So it's very easy for us to
8 commit to an obligation to build in our arrangements because
9 we knew that, at the end of the day, we would support what's
10 in the plan as well beyond just sort of command and control
11 mandates or the threat of penalties.

12 MR. KAUL: Just a quick comment on at least our
13 situation, which is the obligation to serve was kind of the
14 heart and soul of our motivation as a group of utilities and
15 reliability was our No. 1 concern. Our planning is a subset
16 of the MISO planning process and I don't think it's been
17 tested yet, but many people argue that MISO, at least in our
18 case, that RTO has the ability to require transmission to be
19 built. So I don't know if that's going to be borne out or
20 if it's ever going to be tested, but at least in the RTO
21 situation you might have that covered.

22 MR. GESCHWIND: I'd like to just briefly offer
23 the TDU perspective on this. I think there is -- you know,
24 we talk about the obligation to serve. I think there's
25 instances out there within the TAPs ranks of situations

1 where the transmission providers are not planning to serve
2 their network loads to the same level of comparability that
3 they're planning to serve their own loads. And in the
4 written comments that we provided for this, at the end of
5 the comments and in the previously filed TAPs comments,
6 there's a suggestion there's one way to provided maybe some
7 backstop support for this obligation to follow through with
8 the transmission plans and ge the facilities built because
9 that's -- the plan does nothing if the facilities never get
10 built.

11 We'd like to see the transmission provider have
12 an obligation to accept service to a network load if that
13 load were the transmission provider's load it would be
14 accepted and it should be accepted if it's a network
15 customer's load. That gets to some of the granularity
16 differences that exist in the fact that most network
17 customers on a system have discreet loads and discreet
18 resources. They may be intermingled inside a transmission
19 provider's system and it's easier for a transmission
20 provider to come up with the combinations of paths to serve
21 a load if it were their load easier than a TDU with these
22 more discreet loads and resources. So if there's an
23 obligation, as outlined in our comments, for the
24 transmission provider to accept that request if it would be
25 accepted if it were their own load and then to the extent

1 necessary that there may be redispatch costs that should be
2 shared on a load ratio basis within that network I think
3 that starts to send the right signal that the system needs
4 to be planned with facilities that are ultimately built to
5 address not just the transmission provider's load, but also
6 the load of the network customers.

7 MS. JOHNSON: With respect to the obligation to
8 build, most of our plans are based around the reliability.
9 In addition to ensuring that we have continued access for
10 our consumers to low-cost energy. So the economic piece is
11 in there and that covers definitely the CAPX 20/20. It also
12 covers the Colorado long-range plan as well as what's going
13 on with SFPP and their long-range planning efforts.
14 Obligation to build under an RTO it may, in fact, be
15 mandated if SFPP comes out with their ultimate plan on
16 what's required to meet all the generation and load
17 obligations.

18 I just want to respond to Mr. Geschwind. Our
19 network loads are treated on a comparable basis and so
20 irrespective of whether its a native load or a network load
21 customers they're all modeled into the system and the plans
22 to meet those loads are developed as a whole and committed
23 with the same amount of certainty whether it's a native load
24 or another network load customer.

25 MR. KERR: I'd just say briefly what is reflected

1 in the planning collaborative that we have in North Carolina
2 was really to bring all the load on par from with not a
3 legal obligation to build. We wanted it planned for on a
4 par basis and that's really kind of what drove the -- the
5 only other comment I would say briefly is with the recent
6 federal statutory changes and this body's involvement in
7 reliability my personal view and my musings have been that I
8 view this as a very positive development because I think to
9 some extent this agency viewed transmission previously more
10 in economic terms, given its role and I think the square --
11 giving you squarely responsibility for reliability puts you
12 much like the state view has been on reliability. So it
13 seems to me that we each answer to those to whom we answer
14 on reliability and this ought to provide some harmonic
15 conversion of our views of some of these issues. So I've
16 viewed that as a positive aspect of the Energy bill in that
17 regard.

18 COMMISSIONER SPITZER: And the regional
19 reliability entities could be an intersection between the
20 new federal role and the traditional state role. Do you see
21 an opportunity there?

22 MR. KERR: Yes, I think it's going to happen
23 somewhere. I mean we'll do it however. I think the key is,
24 if the lights go out, we're each going to get phone calls
25 from those that we answer to asking what happened and I

1 think that's the kind of things that motivate us and I think
2 ought to motivate us to view some of the problems and issues
3 similarly.

4 MR. LOOCK: Just from a reliability counsel
5 perspective, if a project is mandatory or non-mandatory, I'd
6 hate to see any project decay the reliability of an area.
7 If a project is mandatory to be built possibly one of the
8 stipulations is mandatory at least be conserved if not
9 improved. But if a project is built and the reliability is
10 decayed, I don't understand what we're doing here. We're
11 losing ground.

12 COMMISSIONER SPITZER: Mr. Chairman, one more
13 item very briefly, which is the scope of the third party,
14 independent and again, leaving aside jurisdictional issues,
15 instead focusing on whether they're any economic or
16 structural or engineering issues attending to the third
17 party participation. What would be your insights on that?
18 It's not like law school. We don't call on people.

19 (Laughter.)

20 MR. DeJESUS: I went first last time.

21 COMMISSIONER SPITZER: You're excused.

22 (Laughter.)

23 MS. JOHNSON: Xcel Energy's comments with respect
24 to third party participation is that it should not be
25 mandatory or even required. We've been very successful in

1 our endeavors of regional planning without that third party
2 overhang and I think it could actually prolong the process,
3 add more cost to the process and not necessarily provide a
4 benefit.

5 MR. KERR: I would just say that I think, though,
6 that there are equally good reasons. It might be helpful,
7 for instance, on confidentiality. I mean you might need
8 someone to whom you can work through on critical
9 infrastructure or confidentiality. So that's short of
10 saying it should be mandatory. Briefly, I would relate the
11 story that we are doing a renewable portfolio study in North
12 Carolina. We've called everyone in the room. I mean we've
13 Vern and his guys and we've got the environmentalists and we
14 said we're going to do this. We're the independent party.
15 If there are problems, we will decide. This is not a
16 democracy. Don't get knotted up, but it's going to be our
17 call. Hope we don't have to see you and I promise you a
18 year and a half later we haven't had to see them. So these
19 things can work. Whether you need to mandate that at the
20 outset versus let the process reveal places where they do
21 need someone. They need to come see us or they need a third
22 party and whether that is the reliability, regional
23 reliability organization or whether its Gestalt is doing
24 that for the North Carolina process. I think, again, the
25 types of processes we are contemplating here will reveal

1 whether and to what extent and what type of independent
2 third party as opposed to you all being able to discern that
3 right now I think is the feeling of the state.

4 MR. KORMOS: Obviously, giving a little southern
5 bias view. But obviously, we do believe independence does
6 eliminate some of the problems discussed about load being
7 treated equitably, the nature of the studies and favoring
8 one participant member or participant over another. The
9 confidentiality issue is pretty much non-existent in our
10 planning process. So I think there are a lot of good, valid
11 reasons to look at independence.

12 MR. DeJESUS: We've been beating the drum for
13 independence for a while now, but I guess where you came out
14 in Order 679 is right. An independent entity is consistent
15 with or superior to what's in the OATT and there's lots of
16 reasons. They're all in Mr. Kormos's testimony and
17 practically every filing we've made at the Commission in the
18 last several years.

19 I mean the one thing I will say for now is that
20 having an independent entity gives a little bit more comfort
21 to folks that what was produced in the plan is in everyone's
22 interest. You have somebody's who -- well, let me just
23 leave it at that.

24 MR. KAUL: I guess on behalf of Great River
25 Energy, as a MISO member, we believe -- I guess our planning

1 goes through a MISO process. It's very transparent, lots of
2 stakeholder involvement and I think that should be
3 sufficient.

4 COMMISSIONER KELLY: Can I ask a follow-up
5 question, Marc, on that?

6 Jay and Sandra, in WEC, has there been discussion
7 about having an independent entity involved in regional or
8 subregional planning processes?

9 MR. LOOCK: I believe TPSI is going to be that
10 independent body in the West as in collecting the data and
11 making that data available to entities that want to use it
12 in their transmission planning.

13 COMMISSIONER KELLY: Have they been the
14 facilitator? I didn't understand your answer. They're
15 proposing to do that or they are doing that.

16 MR. LOOCK: They are and proposing to do that at
17 a higher level.

18 MS. JOHNSON: Yes, the TPSI will facilitate that
19 regional planning. But I'd also say that the ARMAS Group
20 did have that third party type of structure and then the
21 SGWI planning process also had a third party. But I would
22 call that more of a facilitating role in that the parties
23 that were participants it allowed for a very large project
24 or study to be conducted and in a fairly efficient manner,
25 but I don't believe it provided any more transparency than

1 would have normally been provided through the regional state
2 processes.

3 COMMISSIONER KELLY: Did it provide any other
4 benefits? Did it provide any benefits?

5 MS. JOHNSON: I would say that it did provide
6 benefits in that it lessen some of the workload of some of
7 the involved parties.

8 COMMISSIONER KELLY: Did it increase trust in the
9 process or more buy-in by the participants?

10 MS. JOHNSON: I'd have to compare it to some of
11 the other planning processes where I've been involved where
12 we didn't have that and I wouldn't say that there was
13 necessarily more buy-in. So I think it's just critical that
14 stakeholder input is allowed for at the beginning of the
15 process and through the process so that we get that
16 collaborative effort and that buy-in regardless of a third
17 party.

18 COMMISSIONER KELLY: Vern and Jim, in the
19 Southeast, have you had the experience of independent
20 facilitators or of another role of an independent in any of
21 your planning processes?

22 MR. INGERSOLL: Yes. We have. Gestalt operates
23 as our independent third party in the North Carolina
24 collaborative process. Their role is as a facilitator to
25 the process to help us reach consensus on issues. As Jim

1 mentioned, the process we've set up has a voting structure
2 of the LSCs and we have found that useful. I think it's
3 important to us in this collaborative approach to reach
4 consensus and not to vote, though we set up a voting
5 structure. And I think having the third party has been
6 helpful to us in that regard to explain things to the
7 parties. Much of the initial process of folks who are not
8 transmission planners is to help them understand the
9 transmission planning process and we have in our process
10 what you might call a policy kind of person from the third
11 party as well as an engineer-type person. So it has been
12 helpful.

13 In Florida, they have implemented an region
14 process using the Reliability Council or the planning group
15 reports to the Planning Committee and they essentially use
16 the staff to provide that separate viewpoint from the
17 transmission owners. So we think it's useful, but I think
18 it's also important to recognize that the transmission
19 providers, whoever that might be -- if they're vertically
20 integrated or an RTO -- have certain obligations, both to
21 their commissions and under the OATT. So that has to be
22 factored in to how a third party functions.

23 COMMISSIONER KELLY: But your experience in
24 collaborative process with a third party facilitator was a
25 good one?

1 MR. INGERSOLL: Yes.

2 COMMISSIONER KELLY: It would seem to me that
3 that might eliminate the need for a dispute resolution
4 process or system.

5 MR. INGERSOLL: We do have a dispute resolution
6 process also, which involves some of the North Carolina
7 folks.

8 COMMISSIONER KELLY: Is that a formal process?

9 MR. INGERSOLL: Yes. They're designated -- what
10 we have in our collaborative is a contractual arrangement
11 amongst the parties that fund it and there is a formal
12 process, but we've never had to resort to it yet -- knock on
13 wood. And again, I do believe the third party has been
14 useful to us in overcoming some of the issues that arise in
15 allowing us to come to agreement on how to proceed.

16 I don't think it's absolutely necessary and it
17 depends much on the structure and I think the really
18 important thing is having the folks at the table so that
19 they can see and understand what's going into the models and
20 have a say in what goes into the models. Once that happens,
21 a lot of the concern about discrimination goes away because
22 they begin to see that what you're really doing is having
23 and being forced to make engineering judgments. None of us
24 have a crystal ball to really know what generation is going
25 to be built. When is it going to be built? Should we

1 commit to build this line yet or should we wait and see what
2 happens next year? How much reserve transmission do we
3 need? So I think the really important part is having folks
4 at the table.

5 MR. KERR: Commissioner, I would just add they do
6 have a facilitator. I don't think Vern said this directly,
7 but in the governance process they each of the four load-
8 serving entities have two representatives. You get to
9 eight. As you all know, an even number can be problematic
10 in voting and so the facilitator is the ninth vote. There
11 were really practical reasons that this independent entity
12 came in, but they came up with that themselves. I mean we
13 didn't say we want it done this way. It was not
14 prescriptive. It was we want it to be independent. We want
15 it to be fair. We want you all to feel good about and we
16 want to feel good about it. Understand that -- you know, I
17 think what's driving a lot of this, at least in the
18 Southeast, is that we understand we're facing an era of
19 significant investments and we want to make sure that the
20 decisions we're being asked to make are based off optimized
21 planning, efficiency. What are the options and what is the
22 optimized planning? And so we wanted to have confidence in
23 the system. What that required, I think, might be different
24 in different places and that's what I would urge you all to
25 be differential enough to let that be decided because I

1 think it's especially true if you all have indicated that
2 you think it is important, if the state regulators have
3 indicated this is important, I think we'll get what we want.
4 Now how we get it might vary from place to place and what it
5 looks like might vary. But I think with some combination of
6 the overarching desire for this to be really optimized
7 planning I think is what we're talking about, removing the
8 black box, letting people have confidence in what are really
9 engineering truths. I mean us lawyers can split hairs and
10 maybe even shade things a little bit. These guys don't tend
11 to operate that way and I think, from the state perspective,
12 we're concerned that this be done cost effectively and so I
13 think being too prescriptive runs the risk of maybe not
14 getting the result we're interested in.

15 COMMISSIONER KELLY: Thank you.

16 MR. MOELLER: Mr. Chairman, given the time, I'll
17 be brief. I admire and support what Commissioner
18 Wellinghoff talks about in terms of Demand Response and that
19 focus. I also feel strongly that the country is way behind
20 generally in building transmission as Mr. deJesus referenced
21 and it's catch up time. So we need to be making these
22 investments in a hurry. My challenge and my focus is kind
23 of on enforceability of regional plans since rarely does
24 anyone work for a regional form of government. They either
25 work for a state or they work for maybe a regional entity,

1 but in terms of who you answer to it's a challenge when
2 you're talking about regional plans who can really enforce
3 them.

4 Now there have been references already to whether
5 obligation to build, whether it's an independent entity, but
6 if you could each briefly comment on that concept, along
7 with the fact that, if you don't have an independent
8 consultant involved, is there the potential for anti-
9 competitive decisions being made?

10 MR. DeJESUS: Commissioner, our obligation to
11 build is in our transmission operating agreement with ISO
12 New England. It's Schedule 3.09, which was filed here. I
13 assume, as we go forward and whatever comes out of the NOPR
14 on planning will be in the tariff and so that will be this
15 Commission's responsibility to enforce. That's not to say
16 that the states won't have a say in it, in fact, we'll see
17 them in the planning process and ultimately when we go to
18 site facilities.

19 One thing a plan can do and the reason why we're
20 comfortable with a commitment to build is it will give you a
21 piece of paper that says this is the collective wisdom of
22 the planning participants that this is the right thing to do
23 and we can take that in whatever forum we go to and I really
24 think that's the helpful piece of planning, at least from my
25 humble lawyer's perspective.

1 MR. KORMOS: I mean I think it's a very real
2 issue. I think we have the benefit of being independent.
3 We have it being very transparent. The states are involved
4 in and yet I think it will ultimately be a fairly big
5 challenge to get the infrastructure actually built and
6 through the state process. We have filed actually with DOE
7 for the quarter designation and we are very hopeful we will
8 get that and ultimately we hope to get through the state
9 processes within the year, but believe the backstop is
10 important also. So I believe it's a very legitimate issue
11 and I think the independence and the openness of the process
12 so that the information gets out there so people understand
13 the problems we're trying to solve and what the real options
14 are. In particular, some of the issues we're dealing with
15 the options are very, very limited at this point other than
16 building.

17 MR. KERR: Commissioner, the regional governance
18 problem has vexed this country for a long time. We've
19 relayed my state's dismal compliance with its obligations
20 under the low level nuclear waste pack. I've volunteered
21 that if we ask to join a regional compact with you, don't
22 take us up on it.

23 (Laughter.)

24 MR. KERR: I think that's a problem. And Joe and
25 I've talked about this. We have the system we have. It's a

1 federal system and it has problems and these are the kinds
2 of things that it reveals. I think, essentially, Congress
3 has answered the question, which is some level of federal
4 backstop. We're not going to not build the things we
5 determine through some fair process we have to have and this
6 is how we'll do it. But otherwise the structure we have is
7 going to have to work.

8 I think what we are left with is to try to come
9 up with, in this context, some sort of effective regional
10 planning processes that again I keep going back, I think, to
11 some combination of shared support from you folks as well as
12 the relevant states within the region is about as close as
13 we can come effectively. I think compacts there's a
14 provision I know in the bill. I just don't see people
15 pursuing that option of more formal regional governance or
16 requirement.

17 I guess I'll stop there.

18 MR. INGERSOLL: Having been at this regional
19 planning stuff longer than I care to remember, it does work
20 but it's sort of like sausage. It's not very pretty to
21 watch it made, but transmission does get built. One of the
22 main things, I think, that prevents discrimination, if you
23 will, or transmission not getting built where it should be
24 built is that the whole process, at least in the Eastern
25 interconnection, which is what I'm familiar with and I'm

1 sure it's the same in WEC. The plans of individual systems
2 are rolled up usually into subregional plans. They're
3 studied again and rolled to regional and multi-regional
4 plans, and it's simply impossible to hide a problem on the
5 system. As to our collaborative with Florida on regional
6 process, as you get more folks around the table who are
7 saying, yes, that's the right load. That's my load,
8 verifying the right load's being used and yes, that's where
9 my resources are going to be coming from, you begin to
10 really address a lot of those issues because the process is
11 open and people see and agree on what's going in.

12 Once the problems are identified, what we've
13 found is that they do see the light of day and usually what
14 happens is initially there's some reluctance. Well, I'm not
15 so sure that's really a problem and you study it some more.
16 But eventually, if it is a real problem, it's there and the
17 transmission providers, in order to meet their reliability
18 standards and other things and the pressure from their
19 customers in the industry, are going to fix the problem.
20 That's been our experience that the problems do get fixed
21 and the transmission gets built.

22 MR. KERR: Commissioner, the other part of your
23 question was about competitiveness and let me just quickly
24 say -- I mean obviously and I think I mentioned that in
25 response to Commissioner Spitzer, an independent entity can

1 help with some of the concerns or become an appropriate
2 conduit or gatekeeper on the confidentiality and the anti-
3 competitive. Similarly, what we have understood and we have
4 filed in the comments, but it revealed itself in the SRUT
5 process is that your existing standard of conduct
6 requirements may, in fact, be an impediment to the
7 communication and so we've asked to consider a safe harbor.
8 We ask for some sort of safe harbor be created. We do that
9 fully supportive of your goal of preventing discrimination
10 and anti-competitive behavior and quite frankly, my view is
11 you all are best to figure out how to fix your own rules or
12 to create the harbor you need. So it's with full support of
13 the principles of the standards of conduct, but also
14 acknowledgement that as we seek to improve communication
15 that's a place that I think you all can provide everyone
16 with some help and some guidance.

17 MR. WYBIERALA: Let me just add from the
18 generator's perspective. NRG, as I stated before, has
19 plants in areas where there's independence and in areas
20 where there's not. It's like night and day. It's just
21 something about having an independent facilitator there with
22 the expertise that understands the issues of the
23 transmission owner and understands the issues of the
24 generator, and the process just tends to get worked out more
25 rather than -- you know, you just get frustrated because --

1 someone mentioned the black box. There is that factor in
2 that you're constantly trying to understand the transmission
3 planning process that the transmission owner uses and
4 understand how they've come up with what they have and when
5 there's a dispute the only way to resolve it is to come
6 here.

7 But also let me make another comment and that is
8 let's also not lose sight of the fact that over the last 15
9 years a lot of the generation has been gas, combined cycling
10 and peaking plants that you could build in 18 months or two
11 years, and that has probably worked against the traditional
12 planning process as I practiced before I worked for a
13 generating company, which was we used to look out 10, 15,
14 20 years and figure out what the load resources requirements
15 were and now you can put generation in, in such short
16 notice, wherever you needed, the transmission planning
17 horizons got compressed and became very short and you don't
18 have the economies of looking out further and making the
19 right decision. But in saying that recently I see happening
20 is that there's a lot more new projects that are coming on
21 that are not short-term gas-type projects. They're nuclear.
22 They're IGC, coal gasification projects. There's new coal
23 plants coming. These plants are going to take years to
24 build. There's probably a minimum of at least a five-year
25 horizon on any of these plants and there's an opportunity to

1 squeeze more economies out of the system by working with the
2 generation side to come up with plans that bring all that in
3 because you have more time to plan for it. You just can't
4 say it's going to be there in two years. I don't have to do
5 anything. So that would be my comment is to just recognize
6 that the generation plays a significant role with how the
7 transmission system does evolve.

8 COMMISSIONER KELLY: Joel testified that while
9 the Commission should not tell regions how to allocate their
10 cost, the Commission should direct individual utilities
11 within each region to come up with a cost allocation
12 proposal that either filed in individual utility tariffs,
13 complimentary tariffs or in one regional tariff. Do any of
14 you disagree with that proposition?

15 MR. KAUL: I don't disagree. I guess that was
16 what made the CAPX projects go. We needed a regional cost
17 recovery mechanism to be decided by somebody and that helped
18 us.

19 MR. KORMOS: I don't agree as well, though, I
20 think in my area we might need a little more help on just
21 even the principles. I think we're still struggling on what
22 are the principles that the Commission wish for cost
23 allocation, some guidance on that and then hopefully a
24 resolution of cost allocation. My biggest fear now is we're
25 starting to litigate case-by-case every transmission upgrade

1 and I really think that's going to be counter-productive
2 going forward, so the sooner we can resolve that in its
3 entirety I think the better.

4 MR. INGERSOLL: This is a difficult issue we
5 think. We have discussed in the collaborative and we've
6 recently had what we call the Central Florida study in
7 Florida where the upgrades covered a large number of systems
8 and I don't have the answer for you. I think I would advise
9 you to avoid being more prescriptive than the OATT currently
10 is. There's a good argument for rolling into the rights of
11 the transmission owner in the area. He's building whatever
12 he builds and letting it go at that and in many cases that's
13 kind of where it comes out when you have a process. But
14 there are other situations, particularly if you get into a
15 large, multi-state or multi-regional transmission line where
16 potentially the folks benefitting are not the folks through
17 which the line is passing. That might need to be different,
18 depending on the circumstance.

19 I think it's going to be awfully difficult for
20 the transmission owners or the Commission to lay out this
21 firm rule that fits every situation. I know that's not a
22 very good answer.

23 COMMISSIONER KELLY: Actually, my question was
24 not -- and I think Joel testified -- not that the Commission
25 would lay out a rule, but that the Commission would require

1 the utilities to have a rule.

2 MR. INGERSOLL: I think that's just as
3 problematic because it's the 80/20 thing. I could say, yes,
4 80 percent of the time we ought to do it this way, but there
5 are going to be these other projects where nobody's going to
6 be happy if you go down that route. So how do you have that
7 flexibility?

8 COMMISSIONER KELLY: Could you have the
9 flexibility by having a general rule that allowed for
10 exceptions? I'm swayed by the argument that if every single
11 transmission project has to be negotiated in advance what
12 the cost allocation is that we're going to spend a lot of
13 time negotiating when we should be talking about what the
14 project should be.

15 MR. INGERSOLL: It is a trade off, but I think
16 that I would err on the side of caution because, in general,
17 what we've found is that at the end of the day, after the
18 discussion, folks are happy to roll it into their rates
19 because they see a general benefit. I don't know how you
20 would spell out that exception -- you know, how I as a
21 transmission provider would spell out what that exception
22 is. We've just begun a discussion in our collaborative if
23 we could have a policy and I think maybe if we were to go
24 down that road, which I'm afraid of, it might be better to
25 ask us to articulate a policy rather than a firm, this is

1 the only way it could be done.

2 MR. KERR: One of the things that happened to us
3 -- I mean you cant' talk about this for five minutes without
4 getting the cost allocation and what we did -- Commissioner
5 Irvin and myself talked fairly early when we first called
6 these folks in to talk about this and we made a decision
7 that if we did too much there we were going to kill the
8 process because that's all anyone would ever focus on.
9 Maybe it was hope over experience, but we said let's talk
10 only about planning and save that for another day and it
11 took some of the pressure off and then the hope was that
12 with better understanding and confidence in the planning
13 that then those decisions would become more apparent to the
14 participants and a little bit less knotty. So that's a bit
15 of advice from our experience that we didn't want to throw
16 that log on the fire and break it all down. I mean it was
17 to set it aside a little bit and be hopeful it would get
18 worked out.

19 That said, I do personally support some
20 reasonable efforts to make those decisions on some
21 appropriate regional -- you know, whatever the area is
22 that's implication so that we don't let the perfect be the
23 enemy of the good. I mean I think to some extent we need to
24 say, look, we're going to do the best we can. SPP was able
25 to do that. I think they did two-thirds, a third and I

1 think that if you just do the best you can and if you say,
2 look, we will look at this again. The nature of projects
3 might change over time. I mean what was economic one day
4 becomes reliability. I think some sense to the changing
5 nature of it and some understanding that, if we do two-
6 thirds and a third and it's not right, we'll go back and
7 we'll look at it and change it. I mean I think a reasonably
8 close or reasonably good principle subject to frequent
9 review and sensitive review is certainly better than case-
10 by-case seeking the perfect that by the nature of the
11 parties positions there's no perfect answer.

12 COMMISSIONER KELLY: And a case-by-case might
13 work much better in a situation like you described where it
14 sounds like it was relatively confined and it was one state
15 and one commission and they were probably going to have to
16 get it built one way or another.

17 MR. KERR: Yes, I think so. My belief is we
18 would hopefully get some sense that there is some general
19 rule so that as you are doing this that people are
20 comfortable with, but don't worry if this isn't perfect
21 because we'll look at it. I mean there will be some chance
22 to tweak and to make changes and based on actual use of the
23 facility and so forth, and just that people will be treated
24 fairly at the end of the day. But we've got to do something
25 here in order to get these projects moving.

1 COMMISSIONER KELLY: Right.

2 Is the situation of long lines different? Does
3 it demand cost allocation in advance more than other
4 situations?

5 MR. KORMOS: I think when you start to look at
6 backbone facilities across multiple state, No. 1, the size
7 of them. We're allocating costs for hundreds of thousands,
8 even millions we didn't have very much objection to whatever
9 method we used. When you start talking billions, people pay
10 a whole lot more attention. I also think, though, that the
11 benefits become much larger to quantify, particularly, when
12 the benefits are very far into the future. These lines can
13 potentially take 10 years to put in place and so when you're
14 trying to look at who's going to benefit 10 years from now
15 there's a lot of entities not even sure they'll be in the
16 business in 10 years, so it becomes very difficult. So I
17 would agree that the longer the lines, the bigger the lines
18 the bigger the problems.

19 MR. GESCHWIND: I would agree as well. And to
20 echo the comments on CAPX, it was this regional cost
21 allocation I think was the thing that put us over the top
22 and it is very different for long lines just because of the
23 same reasons mentioned. If I'm going to invest in a project
24 that's going to be benefit multiple systems, I'm not going
25 to want to foot the bill for that. The cost allocation I

1 think it is a critical component. We just want to add of
2 interest to us is this opportunity to invest. From our
3 perspective it's one thing to be assigned a portion of a
4 project's cost. It's another thing to be, at the same time,
5 given an opportunity to invest maybe up to a load ratio
6 share, for example, in that same project to offset the costs
7 that we are going to be paying, offset that cost through
8 facilities credits back to us.

9 MR. DeJESUS: Commissioner?

10 CHAIRMAN KELLIHER: Go ahead and use one of my
11 three minutes.

12 (Laughter.)

13 MR. DeJESUS: For the record, I don't disagree
14 with my prior comments. But I think that the big issue has
15 to do with certainty and that is a big problem for longer
16 lines, but it's certainly a problem in smaller substations.

17

18

19

20

21

22

23

24

25

1 For substation upgrades, as well, I would
2 respectfully suggest that we need a cost allocation for all
3 those types of facilities.

4 And let me put in a plug for the New England cost
5 allocation, which got about 80 percent of stakeholder
6 approval when we filed it. That cost allocation breaks down
7 facilities, based on function. It's not an arbitrary 80/20,
8 although I guess that works for some folks.

9 And I would commend Verne to look at that,
10 because I think it's a very engineer-focused type of cost
11 allocation. You look at the function and determine roughly,
12 who the beneficiaries are.

13 COMMISSIONER KELLY: Thanks.

14 CHAIRMAN KELLIHER: Do you have a followup?

15 COMMISSIONER KELLY: I was just going to say that
16 that was very good lawyering, to bring the engineers in.

17 (Laughter.)

18 CHAIRMAN KELLIHER: But do you think the New
19 England allocation approach has worked? Is more
20 transmission being built as a result?

21 MR. deJESUS: Yeah, I would think so. I'm not
22 prepared to -- I mean, we've got \$3 billion in our plan.
23 What it has done, it's cut down on the amount of disputes we
24 have on a project-by-project basis.

25 Now we're not arguing about whether a project

1 should be built or where it should be routed; we're arguing
2 about things like undergrounding.

3 CHAIRMAN KELLIHER: Thanks. I just want to make
4 one comment, and then I'm going to ask a couple of questions
5 that hopefully will lend themselves to yes or no answers,
6 just so I use my time efficiently.

7 But a comment: Picking up on something Jim said
8 at the very beginning, that he observed that the state and
9 regional planning efforts preceded the NOPR, that was
10 absolutely correct. In fact, they inspired the NOPR.

11 We looked at some of the success at the state and
12 regional levels, and we decided to reinforce it and
13 replicate it, so I think that was a good observation.

14 I also want to credit SEARUC, in particular, for
15 that meeting, the two-day meeting that we held. Again, it
16 was regional transmission planning.

17 As soon as we put out the NOPR, there was no
18 hostile reaction at the state level. It was a very
19 businesslike, workmanlike approach of, well, let's explore
20 this; it seems like a good idea.

21 FERC is trying to pick up on some of our
22 successes, and let's spend two days looking at how we can
23 actually make it work in the Southeast, so I thought that
24 was a very productive exercise.

25 So let me get to my yes or no type of questions.

1 A lot of the cost allocation questions came up. That was
2 something that I was going to ask about.

3 Joel was saying that it really needs to be
4 decided in advance. I think Ms. Johnson said that it really
5 can't be decided in advance. At least in the West, it's
6 always been decided, project-by-project.

7 But that's really just for the major interties,
8 right, not for routine projects, but, you know, the Pacific
9 interties where those were project-specific cost allocation
10 decisions, I suppose.

11 MS. JOHNSON: Yes, as well as some of the larger
12 joint projects.

13 CHAIRMAN KELLIHER: Okay. One issue we really
14 haven't talked about, is what's the geographic region? I
15 think you all had different views on that.

16 I think Jim said more than one utility; someone
17 else said more than one control area. I think someone said
18 NERC regions should kind of be a default, but I think Mr.
19 Ingersoll said CERC is too big.

20 So, now, in WECC, you have six subregions, and I
21 have no idea how they developed, whether they have been
22 static or whether they've actually been a little bit fluid
23 over time.

24 But are there any lessons we can learn in WECC,
25 and then apply to CERC, and how do you develop subregions,

1 if, indeed, CERC is too big, what would the right subregions
2 be?

3 MR. LOOCK: Well, I think that in WECC, the
4 reason we have subregions, is because we're so big, and the
5 resources are different in different areas. We have
6 resources in the West that seem to be in the Rocky Mountain,
7 Montana, and Wyoming areas, but the load --

8 CHAIRMAN KELLIHER: Is that decided by flows, by
9 transmission flows, to some extent?

10 MR. LOOCK: Some part of it, yes.

11 CHAIRMAN KELLIHER: Okay, well, I didn't succeed
12 on a yes or no answer on that. I didn't frame the question
13 properly.

14 (Laughter.)

15 CHAIRMAN KELLIHER: Let me ask question that does
16 lend itself to a yes or no, and I'll try to have a default,
17 so that silence means yes.

18 (Laughter.)

19 CHAIRMAN KELLIHER: So you don't have to be
20 silent, though. That's a fair way to structure it.

21 I think Joel said, and perhaps others have said
22 that regional and joint planning should look not just to the
23 economic projects, but at -- not just at reliability
24 projects, but at economic projects. And so the question
25 would be, do any of you disagree with that? Do any of you

1 disagree that regional and joint planning should look at
2 both economic and reliability needs? Again, silence means
3 assent.

4 (Pause.)

5 CHAIRMAN KELLIHER: Okay, for the record -- oh,
6 Mr. Ingersoll?

7 (Pause.)

8 MR. INGERSOLL: My response would have to be a
9 "sort of."

10 (Laughter.)

11 CHAIRMAN KELLIHER: Sort of? Okay.

12 MR. INGERSOLL: In other words, I don't think
13 it's appropriate to ask transmission planners to do
14 production cost analysis and so on.

15 So it depends on how you define "economics." On
16 the other hand, we do in the Collaborative, for the LSEs,
17 look at interface capability and what it would cost to make
18 various upgrades, so that they can make the economic
19 choices, versus the transmission planner making those
20 choices for them.

21 CHAIRMAN KELLIHER: Okay. We have to leave this
22 room in two minutes, and we have a lunch, and so let me try
23 to ask one or two really quick questions:

24 A number of you criticized some of the RTO
25 planning efforts; Joel criticized New York ISO, and Mr.

1 Conference was recessed for luncheon, to be reconvened this
2 same day at 12:30 p.m.)

1 maintaining adequate reliability for all users, owners and
2 operators of the bulk power system. NERC also supports the
3 recommendations of it's long-term AFC-ATC Taskforce, the
4 Commission and industry to add increased standardization and
5 consistency to the current NERC reliability standards on ATC
6 and ATC-related values. However, NERC urges caution to
7 ensure that the ATC calculations and their applications are
8 consistent with other NERC reliability standards, regional
9 reliability criteria and transmission owners, operating and
10 planning criteria.

11 Since NERC filed its comments on the Commission's
12 NOI, NERC has undertaken a review and a revision of its
13 standards related to ATC calculation and coordination.
14 Currently, NERC has under active development two sets of
15 existing standards dealing with ATC and its ATC-related
16 issues and CBM and TRM-related issues and NERC is
17 coordinating its efforts with those of the North American
18 Energy Standards Board on a related proposed business
19 practice standard following the NERC/NAESB Joint Standards
20 Development Coordination Procedure.

21 The proposed changes to NERC's existing modeling
22 standards would add a requirement for transmission providers
23 to coordinate the calculation of the TTC, ATC and AFC and
24 require that specific reliability practices be incorporated
25 into the calculation coordination methodologies. The

1 existing standards on TRC and CBM are also proposed to be
2 revised to require crisp and clear documentation of the
3 calculation of TRM and CBM and make various components of
4 the methodology mandatory so that there is more consistency
5 across methodologies. Such changes will enhance the
6 reliable use of the transmission system without needlessly
7 limiting commercial activity.

8 NERC recognizes that the goal of achieving
9 consistency may not mean that a single ATC methodology is
10 required. With a limited number of methodologies,
11 consistency can be achieved if the requirements of those
12 methodologies are properly coordinated and communicated.
13 The NERC Drafting Team, which I'm currently facilitating, is
14 currently working with three methodologies. The first one
15 is referred to as the rating system path methodology for ATC
16 and TTC. We have a network response methodology under
17 consideration for ATC and TTC. And the third one is the
18 network response methodology for AFC.

19 A great deal of progress has been made since the
20 proposed standards were approved for development by the NERC
21 Standard Committee in February, which were to address the
22 recommendations made by the long-term AFC-ATC Taskforce.
23 However, a significant amount of work remains to complete
24 the revisions to the standards. NERC has established an
25 aggressive schedule of meetings for drafting, which will be

1 coordinated NAESB since NERC would like to finalize its
2 revised standards for submittal to the Commission for the
3 Summer of 2007.

4 NERC and the electric industry are giving high
5 priority to these standard revisions consistent with the
6 entire spectrum of standards development activities that are
7 currently underway, especially those standard initiatives
8 that have been undertaken in response to the August 2003
9 blackout.

10 Just as a point of clarification, when we talk
11 about network response, that refers to a method of
12 calculating transfer capability for transmission networks
13 where customer demand, generation sources and transmission
14 sources are closely interconnected.

15 MR. HEDBERG: One minute, sir.

16 MR. LOHRMAN: Thank you.

17 The rating system path method is a method of
18 calculating transfer capacity for transmission networks with
19 critical transmission paths between areas of the network
20 have been identified and rated as to their achievable
21 transfer load capabilities for a range of system conditions.
22 Generally, the rated system path method is used in the West
23 and the two types of network response methodologies are used
24 in the East.

25 With that, I'll conclude my remarks. Thank you.

1 CHAIRMAN KELLIHER: Thank you, Mr. Lohrman.

2 All the panelists should be aware, remember what
3 I said this morning that your statements are in the record
4 in full and the use the time to emphasize, punctuate and
5 summarize -- and that's no criticism to Mr. Lohrman because
6 he did excellent in terms of time.

7 (Laughter.)

8 CHAIRMAN KELLIHER: I just thought I'd repeat
9 that.

10 Next is Mr. Ron Mucci, Williams Power Company on
11 behalf of North American Energy Standards Board. Mr. Mucci.

12 MR. MUCCI: Thank you and I would like to remind
13 I'm speaking for NAESB, not Williams even though I do see
14 Williams on there. I will have to refrain from individual
15 company comments and represent NAESB, the organization.

16 I'd like to say thank you to the Commission for
17 providing NAESB with this opportunity to participate in the
18 888 reform process and we applaud your efforts to increase
19 transparency and clarity to the underlying business
20 processes and practices that will enable non-discriminatory
21 open access transmission.

22 I would like to begin by framing the respective
23 roles, which I think are critical as a back drop. First and
24 foremost, the Commission, which is responsible for the
25 policy and requirements. They are going to be essential

1 that they be laid out. NERC, which as previously discussed,
2 does reliability and NAESB does the accompanying business
3 practice standards. And through our WEQ, which is Wholesale
4 Electric Quadrant, which is comprised of five segments
5 representing end users, LSEs, transmission, generation and
6 marketers and I might add a potential six segment
7 representing independent grid operators. NAESB has built
8 the structure and process in place to develop the necessary
9 business practice standards. However, even with the right
10 processes and structure in place, NAESB's ultimate success
11 in meeting the Commission's objectives will depend on a few
12 key factors.

13 First is clarity. Clarity from the Commission in
14 terms of both policy and expectation. Second is engagement
15 on the part of industry participants and the NAESB standard-
16 setting process, and third is collaboration and coordination
17 with other organizations, such as NERC, to ensure a seamless
18 linkage between reliability and business practice standards.

19 Now focusing on ATC or we would say more
20 appropriately TTC and the apparent lack of transparency and
21 potential for discriminatory practices, the challenge from
22 the NAESB perspective are rooted in two fundamental issues.
23 The first is the methodology employed and result and models
24 used to calculate TTC and ATC that has a direct impact on
25 reliability.

1 The second area is the assumptions used in the
2 models in terms of inputs, operating parameters and
3 timeliness and availability of results. In terms of the
4 former, NERC is clearly leading the effort to standardize
5 the ATC calculations. Therefore, ultimately whether there's
6 one industry-wise methodology, standardization of
7 constituent inputs and component capabilities, commonality
8 of calculation techniques or regional difference that will
9 be determined through the NERC process. In terms of NAESB,
10 as pointed out, we have begun and underway companion
11 business practice standards, which will ducktail with and
12 support the reliability components.

13 In order to facilitate the timely development of
14 these standards, we request that the Commission provide
15 clarity around their expectations and address policy issues
16 up front rather than leaving the subject to potentially
17 endless debate and fruitless effort to develop standards.
18 And you have to understand NAESB, basically, in that process
19 of mapping out those business practice standards looks at
20 the data, the record layouts, posting requirements, who's
21 responsible for posting what information with the ultimate
22 objective of streamlining those processes and added needed
23 transparency.

24 So with that in mind, where clarity and guidance
25 would benefit our processes, some examples around ATC at

1 this point is there ambiguity and a broad spectrum of
2 opinions regarding the specific data and associated posting
3 requirements, which I could boil down to essentially issues
4 related to what I call triggers and transparencies. For
5 example, triggers refers to when and under what
6 circumstances ATC should be recalculated. Without clarity,
7 NAESB could be caught in endless debate deciding such issues
8 as is it posted only on constrained elements in paths or all
9 posted paths? Is ATC recalculated when requests for
10 transmission services are evaluated or confirmed
11 transactions are impacted? Or is it when a certain
12 threshold has been met? Is there an impact in threshold
13 tests with regard to ATC recalculation and posting
14 requirements? And there is a diversity of opinions exactly
15 when and what triggers the need for those calculations.

16 Regarding transparency, the issues that will be
17 debated or could be debated include how often and what type
18 of information should be contained in the required after-
19 the-fact narrative postings? Do the postings apply to ATC
20 changes in day ahead real time as well as planning studies,
21 acknowledgement of a planning study as opposed to detailed
22 assumptions and results of the study being posted? So I can
23 go on with other examples, but clearly what we need is the
24 clarity around those triggering events and transparency
25 requirements.

1 So ultimately, it's difficult at best to develop
2 the business practice standards necessary to support the
3 Commission's goal of transparency when the requirements, as
4 expressed to date NOPR are opaque to some and clear to
5 others or subject to broad interpretation in between. We
6 need policy direction around areas such as confidentiality
7 in the context of disclosure requirements, frequency of when
8 information should be updated and posted, burden of
9 compliance, commonality of methodology versus regional
10 difference.

11 MR. HEDBERG: Mr. Mucci, could you please
12 conclude your remarks.

13 MR. MUCCI: In summary, the key elements for
14 success of policy guidance from the Commission is clarity
15 around granularity, type of data and frequency, broad and
16 active participation in the NAESB process, collaboration to
17 meet clear objectives and defined time lines. So the
18 guiding principle I'd like to leave you with is FERC does
19 policy and requirements. NERC does reliability and NAESB
20 does business practice standards. Thank you.

21 CHAIRMAN KELLIHER: Thank you.

22 Now we'll hear from MR. Steve Naumann, Vice
23 President, Wholesale Market Development, Exelon Corporation.
24 And as I mentioned earlier to you, our former colleague,
25 Commissioner Brownell, is a big fan of yours. If she were

1 still with the Commission, she would be very happy to see
2 you today as are we.

3 MR. NAUMANN: Thank you, Chairman Kelliher and
4 Commissioners. Exelon appreciates the opportunity to speak
5 here. We've added enough paper to the 5000 some odd pages
6 of comments and I won't repeat what we just put it. I'd
7 like to hit a couple of highlights. But first I'd like to
8 give you a little bit of background.

9 Exelon includes two separate transmission owners,
10 ComEd serving Chicago, PECO serving the Philadelphia area.
11 PECO has been a long-time member of PJM. ComEd is a newer
12 member of PJM. The reason I raise that is up until 2004
13 when ComEd became part of PJM and had PJM take over the ATC
14 and the OASIS functions, ComE, as a transmission provider
15 did these things. So we've seen this both from being in an
16 RTO and from having to do this ourselves as well as our
17 affiliate, Exelon Generation, as a customers. So we're kind
18 of coming from all three sides, if there can be three sides.

19 Just to hit some of the highlights. On the
20 challenges, we believe that those doing the ATC calculation
21 must be prepared to change their methodology to conform to
22 what comes out of the NERC process, must be going to best
23 practices and we can't be hung up on "My method is best and
24 I don't want to change." Engineers have real, honest
25 differences of opinion and it may be that both sides are

1 right or neither side are right, but we've got to come an
2 answer. We just can't sit there. Definitions have to be
3 consistent and when someone says TRM it has to mean the same
4 thing. It can't mean different things to different people.

5 Timeline, in our comments we had said there needs
6 to be a deadline. We had thought it might take up to one
7 year. We're gratified to hear that NERC is on a schedule
8 prior to this summer. CBM and TRM, we think one of the keys
9 is that those factors need to be used in the same manner for
10 all purposes, whether for granting transmission service to
11 third parties or whether for expanding the system for one's
12 own network load. If you need CMB, you need CMB -- both
13 cases. If you don't for one case, we don't understand how
14 you can need it for another. So there needs to be
15 consistency.

16 On the information to be transparent, we think
17 there do have to be narratives and we understand the burden.
18 Sometimes there are many small changes in the system that
19 make a small change in ATC and it's difficult to isolate.
20 But there are a lot of big changes that people know about
21 and there's nothing more frustrating for a merchant to ask
22 "Why was I turned down" and the answer to come back "No
23 ATC." Believe me, that has been the most prevalent answer.
24 That honestly doesn't mean anything. You were turned down
25 for no ATC because there's no ATC. So there needs to be

1 better post sticks.

2 And as far as some of the other stuff, we believe
3 that the designation and undesignation of network resources
4 needs to be done on the OASIS. It needs to be done under
5 the same rules as the granting of any other transmission
6 service. We think it's a matter of confidence in the system
7 that all the users are subject to the same analysis and
8 someone can see that none one has jumped ahead of them,
9 other than because it's a higher priority request.

10 MR. HEDBERG: One minute, sir.

11 MR. NAUMANN: I've written some of the metrics.
12 We do think that having metrics summarized is important for
13 market participants because, if you get thousands of pieces
14 of data, the human mind really can't absorb. If it's
15 summarized, it's a lot easier.

16 So again, thank you very much. I'm hear to
17 answer questions and look forward to it. Thank you.

18 CHAIRMAN KELLIHER: Thank you very much.

19 Now we'll hear from Michael Smith, Vice
20 President, Regulatory and Legislative Affairs with
21 Constellation Energy Commodities Group.

22 MR. SMITH: Thank you, Mr. Chairman,
23 Commissioners.

24 I will attempt to be very brief in my opening
25 comments today. Mostly because I'm scared to death of Dan.

1 (Laughter.)

2 MR. SMITH: Avoid the wrath.

3 Constellation really appreciates the opportunity
4 to be here today. In order to put my comments in context,
5 I'd like to explain just a little bit about Constellation.
6 We have as our operating affiliates a merchant generating
7 company, a wholesale power marketer, a retail marketer
8 that's nationwide and a transmission owner. So we see a lot
9 of sides of this issue. We don't see all of the sides of
10 this issue, but we see an awful lot of them and our comments
11 in this docket are informed by that.

12 No surprise that we fully support the
13 Commission's efforts to increase the transparency and
14 consistency of ATC calculations in the OATT. However, we'd
15 like to flip around the order here and we'd like to suggest
16 to the Commission that focus first on the transparency
17 aspects while consistency is being worked out in the NERC
18 and NAESB process that we also support. That's important
19 because transparency really goes to the core of why we're
20 here in the first place, which is this perception of undue
21 discrimination in the provision of transmission service.

22 If transmission providers give transparency in
23 the ATC calculations to their customers, that will go an
24 awful long way toward getting rid of this perception of
25 discrimination that continues to linger under the OATT.

1 That perception of discrimination can truly chill commercial
2 markets in these areas. If transmission customers don't
3 believe they're going to get a fair shake or are at an
4 informational disadvantage, they may not be willing to go
5 try and serve customers in these areas. So really go a long
6 way toward improving that perception.

7 Also, increased transparency is efficient for
8 both the transmission customer and the transmission
9 provider. If I, as a transmission customer, can't replicate
10 with a reasonable degree of certainty the transmission
11 providers is ATC calculations, I can target my requests to
12 paths that I think are going to be granted and we'll stop
13 having this crazy interactive process that Steve described
14 where I want ATC. Well, you can't have it. Why not?
15 There's not ATC. Well, why not? And we go through this
16 time and time again, where that transparency will be much
17 more efficient. That will help both transmission providers
18 and transmission customers.

19 The provision of this data, we believe, should be
20 an interactive process. By the way, we have provided in our
21 comments a fairly extensive list of the types of data we, as
22 a transmission customer, would like to see. That's appended
23 to the written comments that are filed for today as well.
24 If the Commission is inclined to require that type of
25 transparency, we would suggest that fairly soon after the

1 final order, transmission providers and customers need to
2 discuss, be required to meet to discuss the protocols, the
3 timing by which this information will be provided to
4 transmission customers and then have some periodic follow-up
5 and in a stakeholder type process, it maybe could even be
6 part of the regional planning process to ensure that the
7 data is flowing on a useful basis. This is stuff that we
8 can actually use.

9 I'd like to take one brief aside. We have had in
10 this case a lot of filings advocating some type of open and
11 transparent security constraint economic dispatch.
12 Constellation supports going down that road and looking very
13 carefully at that particular idea of transparent redispatch
14 cost in real time. We confined our comments in this NOPR to
15 the framework that the Commission set out in the NOPR, but
16 would certainly encourage the Commission to undertake a
17 review of these issues at an appropriate time, either in the
18 context of this case or in a separate proceeding.

19 Moving on to consistency, again, we support the
20 NERC/NAESB process. We do have a concern that six months is
21 awful fast. We'd like to see the timeline for having
22 something done be set at a firm time period, possibly a
23 year, but with staff review and oversight into the process
24 to make sure that progress is actually being made, perhaps,
25 requiring the process report out to the Commission quarterly

1 on how its going in terms of getting this consistency as
2 best as it can be, given the circumstances between the
3 various transmission providers.

4 In summary, let me just conclude by observing
5 that when the final rule comes out that's going to be the
6 end of the beginning and we're not going to get this 100
7 percent right the first time and the process of improving
8 ATC calculation under the OATT really needs to be an
9 iterative process between the Commission, it's staff, the
10 transmission providers and the transmission customers. If
11 we do that, I think we have a real good opportunity to
12 provide some real benefits to end use customers.

13 Thank you and I look forward to having a further
14 dialogue.

15 CHAIRMAN KELLIHER: Thank you, Mr. Smith.

16 Next we'll hear from Edward N. Henery, Director
17 of Reliability, American Public Power Association.

18 Mr. Henery.

19 MR. HENERY: Good afternoon, ladies and
20 gentlemen.

21 I'm Nick Henery, Director of Compliance,
22 Standards and Reliability for the American Public Power
23 Association. The North American Electric Reliability
24 Council's guidance document dated 1996 entitled Available
25 Transfer Capability Definitions of Determinations requires

1 that the calculation of ATC recognize the necessity of
2 determining ATC values using a regional or wide area
3 coordination to capture the interactions of the electric
4 power flows. Unfortunately, the current reality of that
5 concept of wide area coordination was never quite realized.
6 The various components that are required to determine ATC
7 are established used procedures based upon the regional
8 reliability organization study methods, transmission service
9 business practices or company goals to meet the needs of the
10 market within each of the interconnections.

11 The accuracy and the dependability of ATC
12 calculations are only as good as the accuracy and
13 dependability of the components of the ATC formula. These
14 are, of course, the total transfer capability, the existing
15 transmission commitment, the capacity benefit margin and the
16 transmission reserve margins. The first component of the
17 ATC formula is the transfer capability or what was called
18 TTC. Under the NERC functional model, the transmission
19 planner is the reliability function tasked with calculating
20 the TTC for long-term transmission planning. For short-term
21 transmission planning or operation planning, the operation
22 planners, which is a part of the transmission operator
23 function, calculates the TTC.

24 The TTC in all cases is a prediction by the
25 transmission planner or by the transmission operator of the

1 reliability limit or the total capability of a path, a
2 system or a flow gate for a particular period of time. The
3 accuracy and dependability of the ATC calculation can be no
4 better than the accuracy and the dependability of the TTC
5 values calculated by the transmission planner or the
6 transmission operator. However, accurate TTC values are
7 very important to the reliable transmission planning and
8 real time operation of the bulk electric system.

9 In the Eastern interconnect where multiple
10 regional reliability organizations exist, a collective
11 organization comprised of representatives from each of these
12 groups could establish the long-term planning and
13 operational planning rules for the interconnection. This
14 type of planning program would go a long ways towards
15 producing TTC values using consistent and transparent study
16 assumptions and would minimize seams issues throughout the
17 entire interconnection.

18 The second component of the ATC formula is
19 existing transmission commitments or ETC. The rules for
20 determining and using ETC components of the ATC formula are
21 developed and applied at the individual utility level within
22 the RRO. The different methods or rules by which
23 transmission customers reserve transmission capacity with an
24 individual utility and then schedule the energy over that
25 reserve transmission capacity will often result in different

1 ATC values for each transmission service provider in the
2 same path.

3 This can occur because one transmission service
4 provider will have a rule of decrementing requested
5 transmission capacity from ATC while the other transmission
6 service provider will not decrement the ATC until the
7 transmission capacity has been confirmed as reserved and the
8 energy has been scheduled on the reserve transmission
9 capacity. This is one of those areas where the regional
10 business practice and rules, transmission tariffs or
11 business objectives can and often do clash with reliability
12 rules.

13 MR. HEDBERG: One minute, sir.

14 MR. HENERY: The electric utility industry has
15 been trying for about a decade to determine that the market
16 rules will define the boundaries of the reliability
17 operation of the bulk electric system or whether the
18 reliability rules will define the boundaries of the market.
19 A more fundamental level, transmission service providers and
20 transmission operators often make different assumptions and
21 use different methods to account for the current and future
22 transmission needs of load-serving entities serving bundled
23 retail loads and load-serving entities using wholesale
24 transmission service.

25 Additional industry work is needed to ensure

1 these assumptions and adjustments are relatively consist and
2 transparent to all affected parties within the
3 interconnection. The rules for calculating capacity benefit
4 margin and transmission reserve margins are also determined
5 at the individual utility level. The use of these two
6 values in the ATC formula presently can result in ATC values
7 that have questionable or dependable accuracy.

8 MR. HEDBERG: Sir, your five minutes are up, if
9 you could conclude your remarks, please.

10 MR. HENERY: In closing, there are two points I
11 want to get across. First, the ATC value must be calculated
12 using an open transmission process and must be as consistent
13 as possible within an interconnection, given say, such as
14 network topology.

15 Second, the best way to achieve this is to have
16 reliability standards, not commercial tariffs, require this
17 consistency and openness. Now I have attached my written
18 remarks answers to the questions you ask in the conference
19 notice and I will be happy to address those responses during
20 the Questions & Answer period. Thank you for giving me the
21 opportunity to speak today.

22 CHAIRMAN KELLIHER: Thank you, sir.

23 Next is Mr. Jerry Smith, the Reliance Partnership
24 Manager, Arizona Public Service.

25 MR. SMITH: I'd like to start by thanking the

1 Commission and its staff for proceeding with this technical
2 conference. I think it gives APS and the West a chance to
3 brag a little bit because I think what we're doing out west
4 is sort of what you're looking for in the NOPR. Some of my
5 recent work efforts have been with NERC, NAESB, WEC and the
6 West Connect efforts. APS believes that the standards should
7 be developed in these arenas. APS fully supports the
8 Commission's goal to developing transparent and consistent
9 standards for determining ATC and the components that make
10 up ATC.

11 APS, together with other transmission providers
12 in the West, is determining its transfer capabilities in an
13 open and transparent process in accordance with established
14 and published standards. We ask that the Commission file a
15 rule to recognize this fact and allow the process to
16 continue.

17 In the West transmission transfer capabilities
18 are determined based on the rated path methodology. As Bill
19 mentioned earlier, we use a rated path methodology. That's
20 the transfer capability. The ATC we've developed is done in
21 accordance with WECC determination of available transmission
22 capability within the western interconnection of published
23 standards. The determination of ATC compares within the
24 determined studies of the past transfer capability.

25 The determination of ATC for path begins with a

1 determination of the path's transfer capability. In WEC,
2 transfer capability is determined prior to a new line being
3 brought into service or when modification to the line
4 affects the TTC. Or rack of rated path, TTC is determined
5 in a three-phased process. It's first submitting the
6 project to WEC. Second, assessing the project affects; the
7 third, review and approval by not only the affected
8 utilities, the appropriate WEC committees, but the WEC board
9 of directors.

10 WEC reviews the rate of paths prior to the summer
11 and winter seasons to determine transfer capabilities of the
12 paths. That becomes the paths TTC for the season. Non-
13 rated paths that affect subregions use the same process,
14 however, neither WEC staff nor the board of directors have
15 to approve these. Under WEC, there is no single process for
16 calculating TTC for the path's internal to a single
17 transmission owner.

18 Within West Connect, a transfer capability
19 process, all assumptions, calculations, and methodologies
20 used in the path ratings are posted, including those
21 internal to a transmission provider's system. They are
22 presented to the stakeholders for review. The TTC
23 calculations then remained fixed and change only if there is
24 a physical or operational change to the transmission system.
25 The determination of ATC then becomes a simple math

1 equation. The components of the equation are determined
2 using the WEC ATC determination standard. Through the West
3 Connect transfer capability process, the West Connect
4 members have agreed upon the elements that will go into
5 determining each of the ATC components. The agreed upon
6 elements are then set in the OASIS, the common OASIS for
7 West Connect and can only be changed by the OASIS vendor.
8 They will only be changed upon a written notice from the
9 transmission provider to the vendor. The transmission
10 provider will then post notice on its OASIS as to what the
11 changes were and why the changes were made so that customer
12 or the transmission customer can see why these changes were
13 made and what affects they had on the ATC.

14 We believe this satisfies the NOPR stated policy
15 and objectives, but recognizes that some of the components
16 of ATC may require further review to more clearly determine
17 what makes up the components and I know that NERC and WEC
18 are both working to better define that.

19 APS supports the Commission's efforts to increase
20 the transparency of ATC calculation and we believe that all
21 of the elements that go into the determination of ATC
22 components should be transparent. That includes network
23 agreements, grandfather agreements and curtailments. APS
24 supports working through NAESB to develop the ATC business
25 standard, especially the standards and communications

1 protocols and we ask that the Commission's rules provide the
2 transmission providers and their OASIS vendors adequate time
3 to make the modification.

4 Since I've got 27 seconds left, I'd just like to
5 thank you for your attention and I appreciate your allowing
6 me the opportunity to present APS's position on this topic.

7 CHAIRMAN KELLIHER: Thank you, Mr. Smith.

8 I just want to remind the staff that they're free
9 to ask questions. This is probably an area where I'm sure
10 you're more familiar with the record than we are. It's kind
11 of a difficult area for at least a non-engineer like me to
12 wade through. But let me start with a couple of questions
13 and then colleagues can join in and staff as well.

14 First of all, with respect to NERC, your
15 projection that by next summer you would have finalized
16 three methodologies, perhaps?

17 MR. LOHRMAN: Yes. We realize that's a very
18 aggressive schedule. A lot of it depends on how the NERC
19 standard process goes. As you're aware, they have a
20 procedure for posting, commenting, posting, commenting,
21 balloting. If the industry is able to get together and come
22 to a consensus and do that without an excessive number
23 repostings and recommenting, that could be achievable.

24 CHAIRMAN KELLIHER: So you're using your ANSI
25 process?

1 MR. LOHRMAN: Yes.

2 CHAIRMAN KELLIHER: Are you using the emergency
3 ANSI processes?

4 MR. LOHRMAN: No, it's the regular process.

5 CHAIRMAN KELLIHER: In the case of developing the
6 methodologies, would you be developing standard definitions?

7 MR. LOHRMAN: We're working at looking at
8 standard definitions, standard posting criteria, looking at
9 coordination requirements, looking at issues of dealing with
10 what types of assumptions should be made, how the standard
11 would interact with the planning criteria and the operating
12 criteria. We're also looking at considering the issues of
13 what the data elements would be themselves.

14 CHAIRMAN KELLIHER: When you say "looking at the
15 standard definitions," the end result would be a standard
16 definition?

17 MR. LOHRMAN: Yes.

18 CHAIRMAN KELLIHER: You're not asking the
19 question should there be a standard definition. You're
20 grappling with what the standard definition should be.

21 MR. LOHRMAN: That's correct.

22 CHAIRMAN KELLIHER: Because I thought Mr.
23 Naumann's statement -- most of the key terms in the laws we
24 administer are defined in statute, otherwise we define them
25 by regulation and the meaning is consistent. I find

1 illusive what the rationale would be for non-standardized
2 definitions. I could see how we might want to have more
3 than one methodology at the end of the day for ATC
4 calculation, but I don't know why, as you said, CPM would
5 mean one thing in one part of the country and something else
6 in another part of the country.

7 MR. LOHRMAN: I think we would agree that
8 standard definitions is the end goal. The issue of having
9 different definitions in different areas of the country is a
10 matter of practice and how the different markets and
11 different regions developed.

12 CHAIRMAN KELLIHER: Is there anyone who is
13 offended at the notion of having three approved
14 methodologies, perhaps?

15 Mr. Naumann?

16 MR. NAUMANN: We could live with two.

17 (Laughter.)

18 MR. NAUMANN: We understand the difference
19 between the eastern interconnect and the western
20 interconnection. We've thought about this and we've
21 actually had to deal with this when ComEd was part of Maine,
22 the former Reliability Council, and we just don't see that
23 there needs to be a different methodology for those who use
24 ATC and those who use AFC. That there needs to be one
25 methodology and then a conversion from AFC numbers to ATC

1 numbers. Now if the only difference between the two
2 methodologies is taking the AFC and adding a post-process,
3 an additional process to converting that from AFC to ATC,
4 then if you want to call that a separate methodology, we're
5 fine with that. But the part that goes into those
6 calculations, we don't see physically that there is any
7 difference. It's still current flowing over transmission
8 elements and all the pieces that go in -- the dispatch, the
9 load models, how you handle transactions, what transactions
10 get credited for counterflows. I could go on with a liney
11 of things. All of those things should be treated
12 identically regardless of whether you're an ATC calculator
13 or an AFC calculator. So that's where we differ.

14 MR. LOHRMAN: I'd like just to point out that
15 NERC is not wedded to three methodologies or one
16 methodology. We'll work with whatever the industry and the
17 Commission comes up. But I think being more involved in the
18 standards drafting team, I think we're really headed in the
19 direction that Steve is talking about. There are a few
20 differences between the ATC and the AFC methodologies, but
21 the ones that are similar would basically be the same.

22 CHAIRMAN KELLIHER: Mr. Smith?

23 MR. MICHAEL SMITH: I was going to add kind of as
24 a guiding principle differences between the regions should
25 be rational and explainable, and I personally have a hard

1 time believing that differences in the core definitions of
2 the ATC calculation can be rational or explainable. Now
3 there may be methodologies that kind of come down below that
4 that there could be a reasonable explanation as to why that
5 should be different. But as you talk about the very core
6 elements of this stuff, it seems to be that the consistency
7 should be the absolute goal.

8 CHAIRMAN KELLIHER: Mr. Naumann?

9 MR. NAUMANN: I would almost like to see in a
10 rule the rebuttable presumption. I mean we have said we
11 don't understand why there should be regional differences
12 within the eastern interconnection, but granting that there
13 may be something about a system that I don't understand why
14 it should be different, I think if the rule said the
15 rebuttable presumption is no regional differences with an
16 interconnection and then there has to be a physical reason
17 for such a difference.

18 Let me give you an example. There is one region
19 that says, well, if the impact is only 1 megawatt, even if a
20 flow gate is overloaded, that's okay. I personally don't
21 understand the purpose of that. I don't think that's a
22 physical difference. I think 1 megawatt over a line makes
23 the same overload, whether it's in the far western part of
24 the eastern connection or in Florida or in New England. But
25 what we ended up finding is that difference then gets

1 exploited by people who put in multiple transactions each of
2 which has less than 1 megawatt of impact and suddenly you
3 now have 10 megawatts of impact overloading a facility and
4 you have to deal with it in TLR. So that would be an
5 example to me where there is no rational, physical
6 explanation and a strong statement by the Commission against
7 regional difference -- now I realize that's 180 degree
8 turnaround what our 888 and 889 and I've talked to my boss
9 about that -- p.s. my boss being Betsy Moeller.

10 (Laughter.)

11 MR. NAUMANN: At that time that was the right
12 thing to do. We've now gained 10 years experience and we
13 think the time is here to say this is not the time for 10 or
14 8 different flowers to bloom -- maybe two. Again, we
15 understand the two, but let's go and get it right so that we
16 have coordinated numbers and people have confidence that
17 there aren't special rules for favoring people.

18 CHAIRMAN KELLIHER: Do you think the primary
19 benefit of having a consistent methodology in an
20 interconnection is the reduced prospect of undue
21 discrimination in transmission service or is it also -- is
22 there an efficiency benefit? Is the system used more
23 efficiently? Is there a reliability benefit?

24 MR. NAUMANN: All of them, Chairman Kelliher.

25 Again, this example of the 1 megawatt -- we'll

1 make an exception for 1 megawatt. Well, to me, that's both
2 a reliability and a non-discrimination. So I can take any
3 specific exception and I have to look at it and say, well,
4 it does this or it does that. What they are -- and we
5 understand these are holdovers from the way things have
6 always been done and I'm not saying that -- you know, they
7 were done and they were done well and the system was kept in
8 tact. Or they are because a bunch of stakeholders got
9 together in this region and came to some agreement sometimes
10 which were trade offs -- well, give me this and I'll give
11 you that. As I said 35 years ago in engineering school, we
12 learned something about Kirkoff's Laws and the last time I
13 looked they still are in place exactly the same within North
14 America and that's why NERC should, through its process, say
15 these things have to be defined in way. Everyone won't be
16 happy because there will be differences of people of
17 goodwill. Engineers think differently. By the way, at
18 least you're not dealing with relay standards, then you
19 would have a hundred different right ways of doing it. But
20 everyone is going to have to get in a room and they're going
21 to have to say we're going to agree to this because, in
22 truth, and I'll leave this to Bill if he disagrees, the ATC
23 calculation is not exact. Let's not fool ourselves that
24 you're going to get it down to the last megawatt. There are
25 errors in the data. There are errors in the calculation.

1 The system isn't exactly what you think it's going to be.
2 So to try to get more preciseness in the calculation through
3 fighting over some of these little, little pieces than you
4 can really get, I think is putting form over substance. We
5 have to get a number, a methodology that people say, first
6 and foremost, will maintain the reliability. Second, will
7 give non-discriminatory access and third, will give people
8 the confidence that they are being treated comparably.

9 CHAIRMAN KELLIHER: I'm going to ask the
10 panelists about some of what we've been discussing at FERC.
11 Does everyone agree that the definitions should be uniform?

12 (Panel agrees.)

13 CHAIRMAN KELLIHER: Do people agree with Mr.
14 Naumann that a methodology within an interconnection should
15 be consistent?

16 Mr. Henery, no?

17 MR. HENERY: No.

18 MR. LOHRMAN: I think part of the discussion of
19 whether or not a methodology is consistent goes to what the
20 definition of the methodology is. It's sort of like when we
21 say that word considering three methodologies, actually two
22 of them -- network response methodology for ATC and network
23 response methodology for AFC they're very similar. It's
24 just that one exchanges AFC values and one exchanges ATC
25 values and we would be working on a procedure for doing the

1 translation between the two as Steve mentioned, so in
2 effect, there might be two methodologies.

3 CHAIRMAN KELLIHER: Your point of view is they're
4 the same methodology. There's just the translation.

5 MR. NAUMANN: If that's the difference in the
6 methodology, then they are, in fact, the same methodology
7 and we would agree with that direction. Yes.

8 CHAIRMAN KELLIHER: What's the status quo now in
9 the eastern and western interconnection? How many different
10 methodologies are used?

11 MR. JERRY SMITH: In the West right now there's
12 one methodology used. However, California is looking at
13 going to a flow basin. If that happens, there might wind up
14 being two methodologies used and I believe as long as we get
15 the definitions and the components defined right and we make
16 how we do it very transparent and work with California and
17 possibly some others in the Northwest that are also looking
18 at that, I think that we can come up with a workable
19 solution and maybe evolve to something that's even more
20 efficient than either one of these two methodologies. So I
21 have some concerns if we try to lock it down to one
22 methodology and don't try to allow the flexibility to move
23 forward a little bit.

24 CHAIRMAN KELLIHER: I'm going to refrain and turn
25 to my colleagues and ask them to join in.

1 COMMISSIONER SPITZER: Thank you.

2 Mr. Chairman, just to follow-up on your question
3 regarding the scope of the status quo, I'd ask you to
4 indulge me a little bit because it's certainly helpful to
5 understand where we are now and I'm am the only lawyer in my
6 family. We've got a lot of engineers. They profess exact
7 objective certitude in their profession, so I guess I'm
8 reassured Mr. Naumann that there's not in the engineering
9 profession, but we've got --

10 CHAIRMAN KELLIHER: Their laws don't get amended.

11 (Laughter.)

12 MR. NAUMANN: I am both an engineer and an
13 attorney.

14 COMMISSIONER SPITZER: I understand that, yes.
15 So I see from your resume. In terms of the scope of the
16 current circumstances, you've got four different variables
17 that are components or at least three methodologies so that
18 the uninitiated you take four squared multiplied times
19 three. Do we have 48? I guess I'm trying to ascertain the
20 scope of the current problem or divergence among the
21 centers.

22 MR. NAUMANN: Commissioner, I guess it comes down
23 to what you mean by methodology?

24 COMMISSIONER SPITZER: Mr. Lohrman's identified
25 three methodologies.

1 MR. NAUMANN: You could have the same methodology
2 and yet -- and this is going to be drilling down really into
3 the weeds -- but if, for example, one transmission provider
4 applies TRM, which is transmission reliability margin.

5 COMMISSIONER SPITZER: That's one of the
6 variables. That's one of the four variables, is it not?

7 MR. NAUMANN: There are more than four variables
8 is what I'm trying to say. There's how the dispatch is
9 done. There is how the ETCs, the existing transmission
10 commitments, are modeled. There are how counterflows are
11 taken into account. There are some transmission providers
12 that said, well, if a long-term firm transaction provides a
13 counterflow, well, then I'll put that in the model because
14 that relieves the overload. There are others that say,
15 well, I can't count on that occurring on that hottest day,
16 therefore, I'm going to take the conservative approach and
17 I'm not going to put it in the model. That creates
18 completely different answers and so what I'm saying is there
19 are more than four variables, Commissioner.

20 COMMISSIONER SPITZER: And there are subvariables
21 and it seems to me until we isolate or standardize the
22 definitions of those variables and subvariables it doesn't
23 matter how many methodologies you use. You're going to
24 continue to have disparate results.

25 MR. NAUMANN: Absolutely.

1 MR. LOHRMAN: One of the important aspects for
2 consistency, as Steve was alluding to, is making sure that
3 not only are the definitions consistent, but the way that
4 you apply those definitions to the data and the way the data
5 are incorporated into the model is consistent from timing
6 perspective, from a use perspective and from the interaction
7 across seams as well.

8 COMMISSIONER SPITZER: Are there engineering or
9 reliability reasons why distinct should remain or will
10 remain with in these variables or subvariable? In other
11 words, is there some necessary engineering criteria or
12 demands that are contrary to efforts to standardize?

13 MR. NAUMANN: In my opinion, many of these issues
14 are matters of judgment, of engineering judgment. The
15 counterflow issue I mentioned there is no 100 percent answer
16 that an engineer can give you that all counterflows must be
17 modeled or no counterflows should be modeled. But leaving
18 that decision to -- I don't know how many transmission
19 providers -- ATC calculators we have in North America right
20 now -- but leaving that decision up to that many people to
21 do it the way they want undermines consistency and from a
22 merchant's point of view -- I'll let Michael speak more to
23 it -- I believe undermines confidence.

24 You get everybody in the room and you come up,
25 through NERC, with a methodology. How are you going to

1 model counterflows? What are the specific elements that go
2 into TRM? What are the specific elements that go into CBM?
3 To which models do CBM get applied? Yes, there will be
4 disagreements, but if everyone understands they have to come
5 to an agreement, I believe it will be done. That's what
6 you all did prior to Order 888. You set up a What team and
7 an How Team. You told the people go there and do it, and a
8 bunch of us went down to Dallas and we were the What Team
9 and we said we're never going to do this and we did. I
10 think you need to get the engineers in the room and say we
11 will come up with an answer.

12 CHAIRMAN KELLIHER: Mr. Smith, is the -- Arizona
13 Mr. Smith. How is that? In the path system, does that
14 somehow mitigate or reduce the number of judgment
15 discrepancies that occur or do you have the same phenomenon?

16 MR. JERRY SMITH: I think until we have a common
17 definition of the elements that go into each of the
18 components of the ATC calculation, I think we're going to
19 have a lot of judgmental calls and that's one of the reason
20 I felt that we needed a good definition of the terms and how
21 they're applied similar to what Steve had sort of implied.
22 So I think in the West right now -- we and the West Connect
23 footprint have defined what we think should go into each of
24 these components. We've set it and put it in our OASIS, so
25 we have a standard there, but I'm not so sure that our

1 standard is right when you go looking at the rest of the
2 West. And until we come up with a common language, an
3 understanding of the common terms and how they're applied,
4 we need that. All of us need that.

5 COMMISSIONER SPITZER: Thank you, Mr. Chairman.

6 COMMISSIONER KELLY: When you get finished
7 standardizing as much as you can standardize, will you be
8 able to give us a standard deviation?

9 (No response.)

10 COMMISSIONER KELLY: No. Engineers can always do
11 a standard deviation, can't they? That was a real question.

12 (Laughter.)

13 MR. LOHRMAN: I'm not sure I understand your
14 question, but are you talking about perhaps the differences.

15 CHAIRMAN KELLIHER: It's something like Mr.
16 Naumann was saying that it's not precise in the end. So
17 we're curious as to how imprecise might it be I suppose.

18 COMMISSIONER KELLY: Are you going to be able to
19 give us a plus or minus? Are we going to have degrees of
20 confidence or bounds? When we finish all this are we going
21 to have a good --

22 MR. NAUMANN: That's a good question,
23 Commissioner Kelly. I haven't thought about it all that
24 much or at all until now.

25 (Laughter.)

1 MR. NAUMANN: I would say that, for example, one
2 thing that could be done is where there are different ways
3 of doing something. Now, for example, the dispatch in the
4 case to come up with the TCC, one could say, well, if we use
5 method A and run through a whole bunch of calculations.
6 Then use method B and run through a whole bunch of
7 calculations, you could get some level of deviation. It may
8 not be a standard deviation by the mathematical definition,
9 but I believe that would be one way by taking the different
10 methodologies and seeing the outcomes that you could see how
11 much the outcomes would actually vary, the complexity, just
12 to say is -- the answer may well depend is that, on the
13 whole, that deviation might be small, but on a very specific
14 element right near the generator it could be awful large and
15 that's why the topology matters. Maybe that's something for
16 NERC and some of us to think about some more in our
17 comments.

18 COMMISSIONER KELLY: It sort of gets to the point
19 that Mr. Smith made, I think, that in the short run and
20 maybe in the long run the best thing is to make it
21 transparent then we know where the differences lie.

22 MR. MICHAEL SMITH: That will help tremendous in
23 order to facilitate further commercial transactions for the
24 benefit of end users in the short run, we'll take various
25 methodologies. As long as they're transparent, we can kind

1 of see what's going on there. Then we can drive down to
2 making them as consistent as possible to reducing the noise
3 to a tolerable level. At that point then, if those
4 differences are rational and explainable, that's fine. But
5 the transparency then kind of helps you through your
6 standard deviation problem because at least then we can see
7 in each case that there's a difference how it works in that
8 particular case. We can model it.

9 MR. MICHAEL SMITH: Can I recognize a colleague
10 in the audience, Steve Goeff from the Missouri Commission is
11 back there and I just wanted to say how impressed I am that
12 you're hear listening to our ATC methodology discussion.

13 (Laughter.)

14 MR. MICHAEL SMITH: That speaks very highly of
15 you. So thanks for being here.

16 COMMISSIONER MOELLER: Thank you, Mr. Chairman.

17 Just to follow up on Commissioner Kelly, what are
18 the barriers then for making those calculations transparent?

19 MR. JERRY SMITH: We have none, in that right now
20 we had -- our calculations fairly transparent, but we went
21 to a common vendor and when we went to the common vendor,
22 the standards and communications protocols that were
23 established did not require them to be out on the OASIS and
24 at that point the vendor took it off the OASIS. But we were
25 working with our own OASIS that we developed internally that

1 was there. So we have no trouble with putting them out
2 transparent.

3 And back to your question, Commissioner Kelly,
4 because I believe that, in the West when we stick with the
5 rated system path, we will come up with the same number all
6 the time so long as we have the same definitions.
7 But the rated system path is not based on -- it's not as
8 dynamic as the flow base situation is on the East. So I
9 think we would stay fairly consistent. So I don't think
10 there would be a huge deviation there.

11 MR. NAUMANN: Commissioner Moeller, I don't think
12 there are any barriers to making it transparent. I do think
13 there are practical barriers to making all the transparency
14 useful. Some of the things that go into calculations take a
15 whole lot of expertise and it's really local expertise.
16 Somebody mentioned earlier this morning, in the planning
17 session, operating guides, special protection schemes,
18 really understanding how things like those are used and when
19 they're used and how they fit into the ATC takes a lot of
20 time to understand. I'm not saying it's not understandable,
21 but from a commercial point of view it may be very difficult
22 to get enough people who have those kind of qualifications,
23 put the time in to understand it to turn that around to make
24 it useful.

25 MR. HENERY: The only thing I would like to say

1 in regard to the question about how accurate things will be,
2 keep in mind these are forecasts much like a weather
3 forecast in a way. I think the thing that the Commission's
4 got to realize is, is that the methodologies that had been
5 developed over the years to what people say is calculation
6 ATC really came out of the reliability side of the business
7 when they were calculating -- when the planners calculate
8 the TTC and when the planning operators calculate the ATC.
9 The physical characteristics of the transmission system
10 often dictate utilizing one method versus the other.

11 Steve's absolutely right in the sense that Ohm's
12 Law hasn't changed. Actually, if you understand how those
13 calculations are made, you will see that they're basically
14 calculating in the same way. It's just the way the planners
15 articulate am I going to articulate it as an entire system?
16 Am I going to articulate it as a particular path or am I
17 going to get real granular and get down to a particular
18 substation? That's all that's happening there when you say
19 that.

20 The problem that exists is like as has been
21 pointed out here. Some engineers, to maintain reliability,
22 will put a belt on it and then put suspenders on it and some
23 will even put the safety pins in and that system's not going
24 to go down. And as a consequence, they have a tendency to
25 remove a lot of facilities out of the system to ensure that

1 if something happened they can go get it to keep the system
2 up.

3 What would be very beneficial, and I think NERC
4 is moving in the right direction with this standard drafting
5 team that they have got in doing this is that they're really
6 requiring that the TTCs out here have, within an
7 interconnection, that level of consistencies, the rules for
8 planning. As long as there's a consistent rule for planning
9 it will work.

10 The ETCs is going to be a little more difficult
11 and this is where we're going to have to work with NAESB an
12 awful lot on that because there are some business rules and
13 reliability rules that can clash in here and we've got to
14 make sure that those don't happen. As far as CBM and TRM,
15 those two are pretty much kind of engineering numbers that
16 TRM is -- if you look at a large TRM, it's telling you that
17 the transmission planner doesn't have a lot of faith in his
18 TTC and he's holding out a lot of stuff because he thinks
19 that maybe his load forecast are off or something like this.
20 So as long as we've got the same rules to calculate that
21 throughout, then that's going to remove a lot of Mike's
22 problems here about, oops, are they telling me the truth?

23 MR. MUCCI: I'd like to add on. While NAESB
24 certainly doesn't take an advocacy position as to whether
25 there is one method or multiple methods, but Commission

1 Kelly you raised a point about transparency and I want to
2 say that it can't just stop at the modeling. That you have
3 to flow it through to the business practice standards and it
4 gets back to the issues that I made in my comments. We've
5 heard debates, at least to this point, is when ATC changes
6 is it by this much? Is it every time it changes? When
7 should it be posted? Is it on OASIS or some have suggested,
8 well, what if it's just a website and those who go back far
9 enough will remember EBBs? I mean do you want a consistent
10 format for that information? And someone else made a very
11 salient point. Data is not necessarily information and so
12 how it's laid out, is it retrievable? Can you do something
13 with it? I mean all those issues get around the business
14 processes that ultimately flow from what has been discussed
15 on the panel around the engineering and modeling side. So I
16 just want to say that transparency needs to flow all the way
17 through so that basically users of the transmission systems
18 can take that information and be able to hopefully define
19 some of the issues around what gave rise to? What were the
20 assumptions made? Why did the results come up this way?
21 And that helps, I think, bring credibility to the process.
22 So I just want to say we stand ready to develop the business
23 practice standards and I think they're essential in order to
24 bring that piece of transparency that's ultimately needed
25 for the marketplace.

1 MR. LOHRMAN: I'd just like to say that NERC's
2 drafting team is looking at that and is working on that from
3 a perspective of consistency in definitions, from a first
4 consistency in the application of the assumptions, of the
5 synchronization between the planning and operating criteria
6 and planning and operating horizons as well as looking at
7 how the individual transmission service providers would
8 coordinate with neighboring or adjacent TSPs as well.
9 That's a critical component of this is making sure that,
10 even if folks have the same definitions, the same data and
11 the same assumptions, that they're using them on a
12 coordinated bases so that they're in sync when they do the
13 ATC or the AFC calculation.

14 CHAIRMAN KELLIHER: Kathleen?

15 MS. BARRON: I wanted to follow up on something
16 Mr. Mucci said about the NAESB standards development
17 process. It seemed to me like you came here with a number
18 of questions and you're looking for more clarity from the
19 Commission, and I'm wondering if that reflects some discord
20 or some difficulty in the standard development process
21 because obviously there's a tension in the proposed rule
22 between the Commission from Washington deciding how those
23 issues are going to be resolved as opposed to, as Mr.
24 Naumann suggested, putting the people who know better in a
25 room and having them come up with something. So I'm wonder

1 if the rest of the panel agrees that you'd like the
2 Commission to be more clear and more prescriptive or whether
3 instead these industry groups and the standard development
4 process can do the job?

5 MR. MUCCI: I'd like to reply to that. First of
6 all, as far as the standard-setting process itself within
7 NAESB, it is a voluntary, consensus-driven process. So I
8 want to say that up front.

9 In recognizing that, and actually I think that's
10 an attribute -- and it is an ANSI approved process and
11 organization -- that at the end of the day what I've
12 suggested we need guidance on is were there are policy-
13 related decisions. And quite frankly, if there something
14 that you want to see in a certain way, say it as opposed to
15 leaving it unsaid and then subject to debate. I clearly
16 understand where you're going. The question is to what
17 degree do you micromanage the process and get down into the
18 weeds and as it relates to the business practices to support
19 those, we certainly stand ready to do that. But to the
20 greatest extent that the policy issues can be resolved and
21 as much clarity as to what you're looking for can be
22 expressly stated that's going to benefit us because I can
23 only say by experience because I sat for almost a year on
24 Energy Day and you can sit in these meetings -- and again,
25 I'm not wearing the Williams hat for a minute -- yes, it's

1 speaking both for Southern Energy and Williams and all those
2 spectrums, but you get a very diverse -- and that's the
3 strength of the organization -- but a very diverse group and
4 you can imagine that there's going to be -- if latitude is
5 granted to a large degree, then you're going to be all over
6 the place and that's a very inefficient way to go about
7 setting the standard. So we can do them, but we are asking
8 for guidance and policy direction.

9 CHAIRMAN KELLIHER: Which areas do you think
10 there's the greatest need for policy direction?

11 MR. MUCCI: I highlighted two events. I think
12 there's a lot of debate as to when do you do it. Is it when
13 ATC changes by what? How often? In reading the NOPR and
14 they talked about the 10 percent rule, it seemed to me it
15 was applying towards planning, when you're doing ATC for
16 planning purposes. But when you're down into real time and
17 ATC changes, I think there are some who are very concerned
18 that that could be almost an insurmountable amount of data -
19 - not information, data. And so I think there is need to
20 get clarity around what events drive the need. Is it every
21 time these calculations are performed? Is it ATC and system
22 values or only on the specific elements? It's those things?
23 Where do you believe the information needs to be illuminated
24 in order to achieve the goal of transparency. And then I
25 mentioned some posting requirements because, in the end, a

1 good example was on the narrative and I've at least have
2 heard some view that when a planning study is done that the
3 narrative simply needs to be an acknowledgement that a study
4 was done as opposed to, okay, and what did it say? In other
5 words, what assumptions were in those studies, what modeling
6 pieces and what were the results and is it a push/pull
7 model? In other words, is it up to the market participant
8 to go out and find it somewhere, request it? Or do you
9 expect that when a planning study is done, whatever the
10 timeframe, whether that be operational or longer term
11 planning ATC, TTC and all the other elements without
12 repeating a liney of the alphabet soup, when do you expect
13 that to be posted and how should that be made available?
14 It's those kinds of macro questions -- and again, we will
15 follow-up with written comments -- so recognizing the
16 limited time, but I thought I would give you a couple fairly
17 large examples of where policy guidance and direction would
18 certainly make this a more efficient process to develop the
19 business practice standards.

20 CHAIRMAN KELLIHER: That's a very helpful point.
21 I appreciate that.

22 Dan, Kathleen, any other questions?

23 MR. HEGERIE: I have one question. Mr. Naumann
24 brought up the fact that network resources ought to be on
25 the OASIS as well to make a complete picture as to what's

1 going on. Were you referring to resources to serve native
2 load as well or was it just network services or is this
3 point-to-point?

4 MR. NAUMANN: All network resources. The last I
5 looked you actually -- I don't know if it's Section 26.
6 I've been out of this for a while. There's one section in
7 the current LATT that basically says you have to have a book
8 where you keep all this stuff. Of course, a book doesn't do
9 other people much good. I think all requests for new
10 network resources have to go on the OASIS and when you
11 undesignate and I don't think that's too much of a burden,
12 but to me it seems the only way to bring confidence that all
13 uses of the transmission system are being considered in the
14 same way.

15 MR. HEGERIE: Do you we get push back at all from
16 anyone saying that that's like putting native load on the
17 tariff if we do that. Or do you see that as a separate
18 issue?

19 MR. NAUMANN: I don't think that puts network
20 load on the tariff. It's simply saying that when you
21 evaluate your uses of the transmission system you have to
22 evaluate the uses of the transmission system for everybody
23 in the same manner. I mean it's a takeback to its other
24 conclusion would be -- and I'm not suggesting that there's
25 any transmission provider out there that does that, but the

1 other side would be any integrated company could designate
2 any network resource any time they wanted in any priority
3 and kick anyone else out and I don't think that -- again,
4 please, I'm not suggesting anyone's doing that and I believe
5 no one's doing that. But that would be the other side. If
6 you say that if you do that, you're somehow taking
7 jurisdiction over service to retail load.

8 MR. HEGERIE: By putting it up there, it removes
9 that perception issue that we were talking about earlier,
10 that perception that that kind of discrimination could
11 occur.

12 MR. NAUMANN: No, it's saying that the evaluation
13 must be done by the same set of rules because again that
14 comes down to -- one of the criticism we've heard is -- I'm
15 not going to take up your time going through the history of
16 CBM, which I'm sure no one really wants to hear, but if
17 you're going to use CBM, are you going to expand your system
18 when transmission is no longer adequate to serve native load
19 because of the CBM margin? That's a big issue. People
20 would be more likely to accept the use of CBM if everyone's
21 subject to it and it drives the expansion of transmission
22 system for native load as well as for third parties.

23 MR. HEGERIE: Thank you.

24 MR. HEDBERG: I had one quick question to ask
25 about transparency. There's been some comments made about

1 the provision of information versus data. One of the areas
2 where we were looking for more information than just data
3 was giving some narrative reasons for the changes in ATC.
4 But we've heard a lot of responses about the relative burden
5 of making the transmission provider post, in the narrative
6 form, what has happened, why ATC has changed. I wonder if
7 anyone has any comments on that. We've heard some folks say
8 that you'd have to have fairly sophisticated customers to
9 appreciate that just the data changes in the ATC, so we
10 thought going towards providing more meaningful information
11 on the changes in the ATC would be appropriate. Do you
12 think we've struck the right balance in our proposal?

13 MR. MICHAEL SMITH: Yes, Dan, I think the
14 Commission has between raw data and narrative. With respect
15 to the raw data, I'll take my chances. Right. We live in
16 the information age. Our ability to receive and process
17 vast amounts of data is incredible now and so that would be
18 helpful. I don't buy into this burden argument on providing
19 the raw data. The same thing on the narrative. The
20 narrative is pretty easy to cook up and it provides texture
21 around that data and I haven't heard a credible argument as
22 to a downside to providing that to the marketplace to
23 facilitate commercial transactions.

24 COMMISSIONER KELLY: I would assume that when we
25 give policy direction, assuming we give policy direction,

1 that a lot of the policy direction is going to depend on
2 input we get from the users of the system as to what they
3 use it for, and I would assume that. Do we have that kind
4 of input now or would we have to ask more questions?

5 MS. BARRON: Well, I would look forward to what
6 Mr. Mucci said he's planning to submit. I didn't see that
7 in the comments we have so far.

8 MR. MICHAEL SMITH: I'd just like to add we took
9 off -- in the NOPR, the Commission put together a list of
10 certain modeling data and said is this right kind of thing
11 that transmission customers would be looking for? We took
12 that list and expanded it to a fairly substantial list
13 broken down into modeling data, modeling support information
14 and then benchmarking the forecasting data would suggest
15 that that might be a good starting point. I'm not aware of
16 any comments in response from anybody that said that that's
17 not the right starting point for a subset of data to start
18 disseminating.

19 MR. NAUMANN: Commissioner, we're very supportive
20 of narratives, but I do think there, at some point, does
21 become a balancing act. For a long-term firm transmission
22 service there's plenty of time to try to come up with
23 narratives. For hourly, non-firm transmission service, I
24 personally think it's a fairly useless task. Maybe the only
25 narrative that can go out there is if a major transmission

1 element went in or out of service or something like that
2 that might have affected the numbers, but to ask somebody in
3 the middle of calculating all of that each hour to try to
4 figure out why with the load and the dispatch changes if
5 there are no topology changes. You would assume the changes
6 are then very complex. That might be a burden. So I think
7 in the shorter operational timeframe, other than changes in
8 topology or things like that, it does become a little bit
9 not as helpful and more hurtful to try to put that out and
10 analyze it.

11 CHAIRMAN KELLIHER: Any other questions?

12 MR. JERRY SMITH: I actually wants to say thanks,
13 Steve, because APS agrees with you there and we feel that if
14 you did do that real time type narratives it would be a very
15 burdensome -- operation would be very costly and we don't
16 know that the customer would get any benefits out of it.
17 We're not sure they would be willing to look at all this
18 stuff while they're doing it. So I think longer term, yes,
19 but short-term stuff would be very burdensome on the
20 operators.

21 MS. ERIC: Nobody proposed the three CBM options.
22 The first point is that NERC improved the existing standard.
23 The second one is that CBM be treated as a firm service and
24 there should be a charge for that. And the third one would
25 be elimination of CBM and designation of network resources

1 that are outside the control area. Which option do you
2 prefer and why?

3 MR. NAUMANN: I'm absolutely opposed to Option 3.
4 I think that would harm reliability. There's reserve
5 sharing going on and you would change to where -- I don't
6 know if Mr. Kormos is still in the audience. Is Mike still
7 in the audience? But I think he'd tell you, if you
8 eliminated CBM, the IRM and PJM would no longer be 15
9 percent. It would be above 15 percent. I've actually seen
10 a graph showing, depending on the CBM, how the IRM changes.
11 We'd be opposed to Option 3.

12 Exelon would support Option 2 that there would be
13 a charge or rather not a charge, an increase in the divisor
14 would be treated like a long-term reservation because you
15 can't charge retail load. They've already paid for that.
16 But if you increase the divisor -- getting into ratemaking
17 now, I'm afraid -- the megawatt divisor by the amount of CBM
18 you would lower the point-to-point charge. That way for
19 those using the CBM -- I don't want to say paying for it,
20 but it would be accounted for such that for those who don't
21 have benefit of the CBM they would be effectively paying a
22 lower charge because less transmission is available.

23 We said that I think about seven years ago and
24 one of three or four CBM proceedings that the Commission's
25 had since the beginning.

1 MR. LOHRMAN: I think this speaks a little bit
2 towards the issue of consistency because the way the CBM is
3 calculated and the way the CBM is used can be different in
4 different areas and going back and getting to be more
5 consistently applied could be helpful.

6 CHAIRMAN KELLIHER: Mr. Smith, something quick?

7 MR. MICHAEL SMITH: Why don't we go ahead and
8 wrap up? If that's where you're headed, I don't have
9 anything substantial to add.

10 CHAIRMAN KELLIHER: I think that will have to be
11 the last word for this panel. I want to thank all of you
12 for helping us and we're going to take a shorter break than
13 planned, but resume on time at 2:00. Thank you.

14 (Recess.)

15 CHAIRMAN KELLIHER: We're going to resume.
16 Please take a seat. Let's close the doors.

17 Why don't we start with Mr. Don Furman, Senior
18 Vice President, PPM Energy on behalf of the American Wind
19 Energy Association.

20 In the back of the room, could you please step
21 out into the hallway or stop your conversations. Thank you.
22 We regulate some of you, I think.

23 (Laughter.)

24 CHAIRMAN KELLIHER: And I know who you work for.

25 (Laughter.)

1 CHAIRMAN KELLIHER: So with that, Mr. Furman, why
2 don't you begin.

3 MR. FURMAN: Thank you, Mr. Chairman.

4 I'm here on behalf of AWEA today largely because
5 I can't hold a job. I'm probably unique among the wind
6 development community as being the only executive whose
7 operated a transmission system in the past. I spent
8 probably the last year of the last 10 years as an executive
9 of Pacific Corp where I had jobs essentially responsible for
10 regulation external affairs, but also several years
11 operating their transmission system. I've also got a fair
12 amount of experience prior to this experience as a developer
13 and marketer and as a customer of a number of transmission
14 providers, including many of those who are in the room and
15 speaking today.

16 PPM Energy is the second largest, by some
17 measures, wind developer in the U.S. We control about 1600
18 megawatts of capacity. We have as a goal getting to 3500
19 megawatts by 2010, wind and other renewable resources, but
20 particularly wind are very, very important and I would
21 emphasize very popular these days and they're popular for
22 different reasons and it cuts across red versus blue. It's
23 East Coast/West Coast, in the middle, rural, urban and it's
24 because everybody gets something from renewable resources.

25 We limit greenhouse gases and help to improve the

1 situation with regard to greenhouse gases. Fuel diversity,
2 which is an important factor now that we've seen so much
3 volatility in the gas market reduces our reliance on foreign
4 resources and another thing that is important is the
5 economic development, particularly the wind industry injects
6 into rural America. If you go to some of these project
7 dedications, the impact that it has on the family farm and
8 the ability for people in rural America to keep their kids
9 at home, give them jobs and maintain their communities is
10 really important.

11 And the last thing I would add is this
12 Administration has set as a goal having wind power become 20
13 percent of the nation's energy supply. So it's a very
14 important priority for the country and it's a very important
15 priority, I think, for most of the people in the business
16 because wind is primarily located in rural areas and some
17 distance away from the load centers, the biggest impediment
18 to investment in wind generation is the lack of firm
19 transmission capability and the Commission's efforts to
20 promote construction of new transmission are important.
21 They're critical but they are not going to come in time and
22 it's going to be a real impediment to the development of the
23 wind industry unless we can get more efficient use of the
24 currently existing grid.

25 In the opening comments, Commissioner Kelly

1 referred to -- that we all started out in this 888 business.
2 It was about open access, but it's also about availability.
3 That reminded me -- and please don't take offense to this
4 Commissioner -- but it reminded me of my mother-in-law who
5 likes to --

6 COMMISSIONER KELLY: I'm going to be a mother-in-
7 law soon. That's all right.

8 (Laughter.)

9 MR. FURMAN: My mother-in-law never misses an
10 opportunity to tell me what a great job she did raising my
11 wife and she likes to tell me her philosophy is firm, fair
12 and friendly and it just for some reasons those words popped
13 into my mind because this is a bit of a reach, but firm is
14 about adequate firm capability. I mean that's an important
15 part certainly to the wind industry. Fair is all about open
16 access. But the other thing that I want to leave you with
17 is friendly is very important and wind is different from the
18 rest of the resources. It is intermittent. It does create
19 some operational issues that don't exist with other
20 resources and so it's very important that transmission
21 policies be made because we've got this national goal of
22 increasing our percentage of renewable resources. We will
23 never get there unless we think about the impact on
24 renewables that transmission policy has. I want to really
25 emphasize that.

1 This panel is talking about conditional, firm and
2 redispatch -- and I'm wrapping up, don't worry -- about
3 conditional, firm and redispatch and both of those are
4 premised on the idea that we don't fully utilize the
5 transmission system to its full capability. It all has to
6 do with how we set ATC a couple of hours out of the year on
7 a given path can reduce -- can mean that that path or that
8 flow gate can't be sold on a firm basis and there's a lot of
9 capability in the system that is not being utilized and
10 whether it's the renewables business or other areas of the
11 market, it only makes sense for us to take advantage of
12 that.

13 So we are advocating very strongly in favor of
14 that and we're advocating very strongly in favor of both
15 products because we want the flexibility to use both
16 products or either product where they're available. And
17 with that, my time is up and so I will conclude. But thank
18 you very much for the opportunity to be here. We really
19 appreciate it.

20 CHAIRMAN KELLIHER: Thank you.

21 Before I recognize Ms. Alexander, I just want to
22 say that I think some of the panelists have planes to catch
23 and so it's important that we end at 4 o'clock. Does anyone
24 plan to leave before 4 o'clock or can you all stay through
25 4:00? You can stay through 4:00. Great. So why don't we

1 shoot to end at 4:00 because we go beyond that I know my
2 wife will be very unhappy with me because I will be late to
3 meet her. So let's stick to 4:00 and we'll go efficiently.

4 Let's now recognize Patricia Alexander, an energy
5 consultant with Dixon Sharipo on behalf of the Electric
6 Power Supply Association.

7 MS. ALEXANDER: Thank you. I am here speaking
8 today on behalf of EPSA. The NOPA and the comments really
9 posed three main questions. Whether the existing redispatch
10 requirement should be maintained, whether a conditional firm
11 product should be added to the OATT and what terms and
12 conditions should apply to redispatch or conditional firm
13 products? The answers to the first two questions are truly
14 easy for me.

15 Redispatching conditional firm products provide
16 an opportunity for customers to obtain transmission that
17 would not otherwise be available or would not be available
18 economically. Other than a reliability problem or
19 congestion that potential exist in a few hours of the year,
20 today the only way to get service is to construct costly
21 upgrade. If the OATT is not amended to ensure these
22 products are provided in circumstances where they can be
23 offered without adversely affecting reliability, the OATT
24 will impose unreasonable cost on customers. It will create
25 unnecessary barriers to competition and will be at odds with

1 the objectives the Commission's open access policies.

2 The third question I admit is a little bit more
3 difficult. What are the terms and conditions of the
4 service? But these problems are insurmountable. The
5 Commission, the industry successfully wrestled with
6 difficult problems the first time around in the OATT the
7 first time around and Steve Naumann talked about the What
8 and the How Groups. The industry figured out how to do all
9 the curtailment priorities that Commission put in the tariff
10 that seemed impossible at the time. More recently the
11 Commission and the industry together figured out how to
12 provide interconnection and transmission as a separate
13 product, which at first would seem to be impossible. So
14 these can be solved if you roll up your sleeves and figure
15 out how to do it rather than whether to do it.

16 Touching on a few of the questions that we tabled
17 for today's conference. EPSA believes there's no reason to
18 insist that the conditional firm product be defined based on
19 a set number of REV years or based on the occurrence of a
20 defined contingency. The fact that neither method may work
21 in a particular case is no reason to arbitrarily exclude one
22 option over the other from consideration. Once the study
23 results are available, the transmission provider should be
24 able to determine what methods are feasible. The customer
25 can look at that, look at the advantages, the disadvantages

1 of either and make a decision.

2 Also, conditional firm should be assigned to firm
3 priority at all times when the condition is not triggered.
4 When the condition is triggered, firm customers should have
5 the highest priority over non-firm. Conditional firm should
6 not be offered only as a bridge product until the
7 transmission upgrades, regardless of cost, are completed.
8 While it may often be the case that expansion can be
9 affected during the term of the transaction -- and in those
10 cases the transmission provider should put the expansion in
11 its plan.

12 It may also be the case that the expansion
13 solution is not economic. If the cost of mitigating a
14 contingency that's expected to arise in only a few hours a
15 year is prohibitive, it's simply not prudent to undertake
16 that expansion, whether the transmission is being used by
17 native load or by the OATT customer.

18 EPSA doesn't agree that customers should be
19 forced onto "and" pricing as the means for obtaining
20 compliance with the Commission's longstanding requirement
21 for redispatch. The only thing that's advanced by the
22 commentators in favor of "and" pricing are the very same
23 arguments that were advanced 15 years ago in pinlack and
24 Northeast utilities and Public Service of Colorado, other
25 cases. The Commission has already determined that "and"

1 pricing is not just unreasonable. The Courts upheld that
2 determination and the passage of time can't legitimate "and"
3 pricing. Charging twice was wrong then. Charging twice is
4 wrong now.

5 There should also be no difficulty in
6 establishing mechanisms for calculating and verifying
7 redispatch costs. Again, the Commission and the industry
8 have some experience in dealing with rates that are based on
9 out-of-pocket costs. For 20 year, market-based rates were
10 really called coordination cost-based rates and the energy
11 prices were based on incremental cost. Today imbalance
12 charges are based on incremental cost, so there are ways to
13 measure, quantify and I would hope verify the derivation of
14 these kinds of charges. Similarly, competitive suppliers
15 can design and implement rates under which they could
16 voluntarily offer third party redispatch service just as
17 they design and implement rates for other power services
18 today.

19 EPSA looks forward to working with the Commission
20 and with others to develop some practical solutions to some
21 of these "How To" problems.

22 CHAIRMAN KELLIHER: Thank you very much, Ms.
23 Alexander. I want to welcome you back to FERC.

24 MS. ALEXANDER: Thank you.

25 CHAIRMAN KELLIHER: Now I want to recognize John

1 Lucas, Transmission Service Director, Southern Company
2 Services.

3 MR. LUCAS: Thank you very much, Mr Chairman.
4 Southern Company very much appreciates the opportunity to
5 speak here today and provide comments to the Commission.

6 I'll start with the redispatch product. One
7 revision that is suggested by the Commission is to provide a
8 preliminary estimate of the hours and the costs for
9 redispatch at the time a system impact study is done.
10 That's problematic for several reasons. First being, the
11 process works like this the provider does a facilities study
12 at the end of a system impact study and that's where the
13 provider indicates what improvements are needed to solve the
14 constraints, the time needed to construct those and the
15 costs. Having redispatch as an optional study before the
16 facilities study is done, just tears that process apart and
17 makes it unworkable, mainly for the reason the facilities
18 study may well, in fact, identify improvements that are able
19 to be completed before the start date of the service and the
20 cost of the upgrades may not trigger OATT pricing it at all.
21 When you compare the cost and timing of improvements to
22 redispatch, it's the only way to know if building facilities
23 is going to solve the congestion or not.

24 Turning now to some of the complexities and
25 difficulties that operators have and transmission providers

1 have in offering redispatch service, at the start offering
2 redispatch it could very well reduce planning reserve
3 margins. The provider, if he reduces generation output to
4 accommodate a long-term firm point-to-point transaction,
5 that's going to reduce capacity that the provider has to
6 serve native load. And in most cases providers are going to
7 feel that redispatching resources and possibly reducing
8 reserve margins to unacceptable levels is not going to allow
9 them to continue to offer service that not impairing
10 reliability of service to firm customers.

11 As a result, I think the bottom line is
12 redispatch options of the providers resources at peak are
13 rarely possible without impairing reliability, given today's
14 slim reserve margins.

15 Just a few more operational points, before
16 offering redispatch the provider has got to be okay that he
17 can manage the real time operational risk without degrading
18 or impairing reliability of service to others. I think that
19 providers typically rely on redispatch to manage reliability
20 in real time. So if we offer redispatch based on a planning
21 study result, it's going to reduce that flexibility. When
22 you do that, then you're going to subject traditional firm
23 service to more curtailments due to the fact that the
24 redispatch scenario won't be available in real time.

25 And then lastly on redispatch cost recovery

1 point, this is not "and" pricing. The Commission must allow
2 providers to recovery the full actual cost of using their
3 generation and the cost of using their transmission system.
4 This is not "and" pricing. This is two separate and
5 distinct services and the pricing should not involve any
6 artificial price caps.

7 With the little time I have left, I'll just make
8 a couple of observations on conditional firm. One big
9 caution. Allowing conditional firm as a pseudo firm
10 product, we've just got to make sure that providers are able
11 to meet existing and future NERC reliability standards. We
12 can't short circuit those. The provider must be able to do
13 that and I would encourage the Commission allow flexibility
14 in setting the service conditions. Customers and providers
15 across different regions may prefer a menu of conditions.
16 Let customers and providers negotiate the conditions within
17 some set of OATT guidelines. One of the things we think
18 would be the most workable for customers, transmission
19 planners, transmission operators would be to give a load
20 level, a set of load ranges, a set of seasons wherein those
21 could be the conditions that are handed to a customer to say
22 during those periods your service may be conditional. It
23 seems to be a lot easier to predict and so forth.

24 Then one last point, both redispatch and
25 conditional firm should act only as a transition mechanism

1 until upgrades are in place. Otherwise, if you don't do it
2 that way, the goal of encouraging new transmission
3 investment infrastructure is going to be compromised if you
4 don't consider upgrades to address the constraints that are
5 identified in trying to offer the service.

6 With that, I conclude and look forward to your
7 questions.

8 CHAIRMAN KELLIHER: Thank you.

9 Now recognize Lauren Nichols-Kinas, Public
10 Utilities Specialist, Bonneville Power Administration.
11 Thank you.

12 MS. NICHOLS-KINAS: Thank you, Mr. Chairman. On
13 behalf of Bonneville, I'd like to express our appreciation
14 for the ability to have this conversation and these comments
15 were developed in the context of the work we've done at
16 looking at conditional firm in terms of BPA's specific
17 constraints and needs, so I want to caveat what I'm going to
18 say with that.

19 BPA believes that conditional firm service has
20 merit for increasing long-term firm ATC in the Pacific
21 Northwest. Conditional firm services appears to be the only
22 viable approach to creating additional long-term firm ATC in
23 areas such as the Northwest, which rely primarily on
24 bilateral market structures and which have significant
25 hydroelectric generation. Hydroelectric power is not

1 suitable for creating long-term firm ATC through redispatch
2 because of the uncertainties that are inherent in
3 hydroelectric generation, which is the predominant source of
4 redispatch for our region. Hydro generators cannot reliably
5 predict when or whether generation will be available to
6 provide necessary redispatch and cannot assure any
7 particular pattern of generation dispatch or redispatch over
8 a long period of time. Unlike thermal generation, hydro
9 projects have multiple uses and must be operated to provide
10 for navigation, recreation and flood control as well as the
11 product of power. All of these uses can affect the way that
12 the operator must dispatch the system.

13 In addition, hydro operators cannot predict the
14 constraints on power production because of the need to
15 mitigate the impact of the hydro system on fish. At times
16 BPA could be faced with the need to generate additional
17 power or even to sacrifice power production to protect
18 migrating fish. Hydro operating plants for fish mitigation
19 may change annual and near-term operations sometimes must be
20 changed weekly.

21 Finally, a hydro system is operated as an
22 interconnected unit. Release of water at an upstream
23 project on the Columbia River will result in generation of
24 power downstream later in the day or the next day. Unlike
25 thermal plants, hydro plants in such a system cannot be

1 dispatched independently. Therefore, at least for the
2 Pacific Northwest, BPA supports the Commission's proposal
3 for conditional firm service under the following conditions:
4 to minimize the need for information system changes, BPA
5 believes that conditional firm hours should have the same
6 curtailment priority as secondary service. In addition, the
7 e-tag should reflect that priority at the time of submission
8 so that the transmission provider does not have to design a
9 process in which to convert that transaction to the
10 conditional firm priority at the moment of curtailment when
11 time is very short.

12 To implement conditional firm service, BPA would
13 expect to develop a counting function to ensure that each
14 time a conditional firm curtailment was made the number of
15 hours curtailed would be subtracted from the total of the
16 conditional firm hours for that month or that year. If the
17 full contract limit for the conditional hours for the month
18 or the year was ever reach, BPA would then notify the
19 customer, after which the remaining hours in the month or
20 year would be e-tagged with the same curtailment priority as
21 firm service.

22 BPA believes that the monthly limitations would
23 be the most consistent with our ATC methodology. The
24 transmission provider must be allowed to identify an
25 appropriately conservative number of conditional firm hours

1 for every conditional firm month. For each reservation, a
2 conservative cap is necessary to protect other firm
3 customers from having their transmission service degraded by
4 the sale of conditional firm service while providing the
5 purchaser of the conditional firm service with certainty
6 with regards to its additional curtailment risk. This
7 certainty would allow the potential conditional firm
8 customer to determine whether the conditional firm service
9 offer would meet its business needs. The product could also
10 be designed so that the lower curtailment priority would
11 apply only when the constraint requiring the curtailment
12 occurs on a path or flow gate specific basis.

13 BPA would study the potential conditional firm
14 offers by examining our posted flow gate ATC and our
15 curtailment histories on those flow gates. When offered
16 conditional firm service, customers should have the option
17 of requesting construction to convert conditional firm
18 service to long-term firm or accepting the conditional firm
19 product on a long-term basis. This choice would allow each
20 customer to assess the economic benefits of firming up the
21 conditional firm hours or portion of the service. If
22 conditional firm service could be offered only as a bridge
23 product, some customers might be forced to reject the offer
24 as too expensive, even though they could have used the
25 conditional firm service to meet their long-term business

1 needs.

2 In summary, conditional firm service can provide
3 PTP customers with access to long-term firm transmission
4 that they previously could purchase only on a short-term
5 basis. As a next step, the industry should examine
6 mechanisms to provide network service customers with
7 comparable long-term access to this ATC as well.

8 Further, BPA recommends that the Commission take
9 no action to preclude transmission providers from making
10 this additional ATC available to NT customers on a long-term
11 basis if they can develop an effective method for doing so.
12 Thank you.

13 CHAIRMAN KELLIHER: Thank you very much.

14 Now I'll recognize Anthony Taylor, Director of
15 Transmission, Williams Power Company. Thank you.

16 MR. TAYLOR: Thanks to the Commission and the
17 staff for addressing the issue of OATT reform. At Williams,
18 I'm responsible for providing technical and transmission
19 expertise in support of commercial transactions and
20 contractual obligations. Prior to Williams, I spent 13
21 years at Energy working every aspect of the transmission
22 business, including planning policy design, operations and
23 managing the wholesale billing tariff administration,
24 compliance and system coordination functions.

25 While we applaud the Commission for the proposed

1 changes, we respectfully recommend the Commission adopt
2 transparency and clarity as the central theme of the new
3 OATT. For instance, in terms of CBM, the Commission should
4 require firm generation supply contracts in order to reserve
5 transmission capacity at CBM. This will effectively hold
6 transmission owners to the same sourcing standard as
7 transmission customers are currently held. In terms of
8 additional data posting to increase the trust, validate fair
9 and nondiscriminatory treatment and to enhance grid
10 reliability, the Commission must require the posting of real
11 time power flows and monitoring limiting elements,
12 constrained area and system loads and import and export
13 limits for constrained areas.

14 In terms of redispatch and conditional firm
15 service, the Commission should allow the customer to decide
16 which services best meets their individual needs on a case-
17 by-case basis, allow non-affiliated generators to
18 participate in the provision of redispatch to ensure
19 competitive pricing. And in terms of conditional firm
20 service, the transmission provider must be provided with
21 sufficient detail in order to make a decision on whether or
22 not the conditional service is adequate to meet the
23 customer's need, i.e., restricted time periods, specific
24 load conditions or limits and contingencies.

25 The transmission providers would say that the

1 Commission, in fact, should tighten the requirements for
2 reservation, retention and funding of the development of
3 transmission capacity. The transmission customers would
4 disagree. Transmission customers would argue that the
5 proposed OATT enhancements do not go far enough.

6 Because of the lack of transparent operational
7 data, the transmission customer is unable to foresee or to
8 verify the validity of a supposed system problem. This lack
9 of transparent operations directly impacts decisionmaking
10 and jeopardizes grid reliability. To enhance the security
11 of the grid, the Commission must require more than the
12 posting of transactional metrics. The Commission must allow
13 access to transparent operational data such as access to
14 real time power flows across limiting elements, system load,
15 export and import limits just to name a few.

16 In terms of the panel topic, redispatching
17 additional firm service, I offer the following four points.
18 Transmission providers contend that they do not use
19 redispatching and plan to serve native load or network load.
20 I disagree. Transmission providers develop and plan to
21 implement operating guides and procedures as a means to
22 mitigate expected contingencies while continuing to meet
23 load rather than investment in infrastructure. Transmission
24 providers do this either by changing system topography or
25 altering the dispatch of selected units; (2) transmission

1 providers that if conditional firm service is offered, they
2 must be allowed latitude to cancel the service as system
3 conditions change because they do not have the tools to
4 predict all of the circumstances that may arise. This is a
5 smoke screen and the risk of unknown assumptions in offering
6 additional firm service is no different than the risk
7 transmission providers currently accept in the provision of
8 firm or network service today; (3) transmission providers
9 express concern over the free ride effect if party A chooses
10 to take conditional firm service and party A opts to upgrade
11 the grid, effectively lessening the probability of the
12 identified condition occurring. This risk is no different
13 than a customer choosing to make network upgrades to ensure
14 deliverability with firm service. The grid is enhanced for
15 the benefit of all transmission customers, including non-
16 firm and native load; (4) transmission providers also
17 contend that, if they are to offer conditional firm service,
18 they need a simple threshold test like load level to avoid
19 confusing the system operator with complex or varying terms
20 and conditions. NERC certified system operators are used to
21 dealing with multiple operating guides, standards and
22 complex procedures to ensure the integrity of the grid in
23 the balancing of load and generation in the provision of
24 transmission service.

25 MR. HEDBERG: One minute left.

1 MR. TAYLOR: The transmission provider can
2 provide his operators with a simple crib sheet categorizing
3 segmented by customer, condition, limit, hour, et cetera.
4 The provision of conditional firm service is fundamentally
5 no different to the interruptible services historically
6 offered industrial customers.

7 In conclusion, transparent, redispatch
8 conditional firm service or transmission service products
9 that will serve to increase more efficient use of the grid
10 lead to infrastructure build out and enhanced system
11 reliability for all market participants. The transmission
12 customer must be allowed to choose which product best meets
13 its needs on a case-by-case basis. Transparent real time
14 operational data such as system load, power flows across
15 limiting elements and transaction-specific conditions all
16 serve to advance the competitive marketplace.

17 That concludes my remarks and again, thank you
18 for the opportunity to address the Commission.

19 CHAIRMAN KELLIHER: Thank you.

20 Now I want to recognize Natalie McIntire, Senior
21 Policy Associate, Renewable Northwest Project and I think
22 you actually have the prime location for the whole day
23 because you have the last word here among the panelists.

24 (Laughter.)

25 CHAIRMAN KELLIHER: And you're at least the

1 second RPI graduate that we've had.

2 MS. McINTIRE: Where I come from on the West
3 Coast, people don't know what RPI is.

4 CHAIRMAN KELLIHER: The winters were kind of
5 touch. With that, why don't a recognize you and look
6 forward to your comments.

7 MS. McINTIRE: Thank you. I think I'll try to
8 leave the last word for you, though.

9 (Laughter.)

10 MS. McINTIRE: First of all, I want to thank you
11 all for having me to participate on this panel. We
12 appreciate the opportunity and I want to briefly state that
13 RMP is a regional non-profit advocacy and policy
14 organization in the Northwest working to increase the
15 generation and sales of renewable energy. Our member
16 organizations include energy companies, consumers
17 organizations and environmental groups.

18 I also want to note that I was a panelist in a
19 workshop FERC held in Portland in March of 2005 to discuss
20 new products, including conditional firm and we've also
21 filed comments following that workshop and on this current
22 docket. So we've been very pleased with the Commission's
23 interest in developing new products like conditional firm
24 and redispatch as tools for utilities to make more efficient
25 use of their existing transmission systems. These products

1 can help bring on new generation resources to serve load and
2 in some cases provide a bridge until new transmission lines
3 are built.

4 I'm going to focus my comments on conditional
5 firm, but I want to briefly make a few comments on the
6 importance of both of these transmission products.
7 Utilities and transmission providers are experiencing
8 greater use of the transmission grid for more complicated
9 market transactions than ever before and at the same time
10 there's been limited investment in transmission additions
11 over the past decade or so. So redispatch and conditional
12 firm can make greater use of many of the transmission paths
13 that are congested on a contractual basis, but where
14 capacity has shown to be available in all but a small number
15 of hours of the year.

16 We believe that the Commission should not be
17 asking which one of these products is more appropriate for
18 transmission providers, but should be requiring that
19 transmission providers look at both of these options as ways
20 to offer new transmission service. In some cases
21 conditional firm may be less costly than redispatch and may
22 provide a solution to a customer's needs where redispatch is
23 not an option. And for many utilities conditional firm may
24 be simpler to implement. But ultimately, for both of these
25 products to enable the financing of new generation

1 resources, it's essential that customers be able to predict
2 with as much certainty and transparency as possible the cost
3 of obtaining these products before they sign contracts.

4 So in months where no firm capacity is available,
5 two options have been recently discussed for the conditional
6 firm product. Customers could take conditional firm service
7 subject to a defined contingency, contingency option, or
8 subject to a lower than firm curtailment priority for a
9 defined number of hours in defined period, the curtailed
10 hours option.

11 We believe that both of these options can be
12 implemented, however, the curtailment hours option provides
13 the greater certainty that will be more likely to result in
14 transmission contracts that can enable new generation
15 resources to come online and get financing. Conditional
16 firm service has been discussed through a public process at
17 Bonneville Power Administration and many of the
18 implementation details have been considered and addressed
19 there and RMP believes that this is a viable product.

20 I want to just briefly describe some of the key
21 elements of conditional firm product that we think are
22 necessary in order for it to work for financing new
23 generation. It must be a long-term product offered to
24 customers in the long-term firm queue. In months where the
25 transfer capacity is shown to be available, customers should

1 be given firm service and treated like all other firm
2 customers. During the months where no firm ATC is
3 available, the conditional firm customer should be curtailed
4 with secondary network customers for up to the defined
5 number of conditional hours or under the specified
6 contingency and that contingency or defined number of hours
7 needs to be set at the beginning of the contract and must
8 not change throughout the contract. This less than firm
9 curtailment priority should be invoked only to maintain
10 reliability and should not be called on for economic
11 reasons.

12 If conditional firm is being used as a bridge
13 product until new lines are constructed, customers need to
14 be informed of any requirement or financial contribution to
15 the upgrade at the beginning of their contract and we also
16 think that conditional firm must allow utilities to
17 designate a resource as a network resource.

18 Having worked with Bonneville over a significant
19 time to identify a critical implementation details for
20 conditional firm product, we recognize that there is more
21 than one way to implement this product and therefore we
22 suggest to the Commission that you task a group of
23 stakeholders with working through the details of these
24 products that would allow the Commission then to include a
25 workable set of criteria for new products in your OATT

1 revision.

2 Thanks again for letting me participate and look
3 forward to questions.

4 CHAIRMAN KELLIHER: Thank you very much.

5 Alex, anyone want to start? John?

6 COMMISSIONER WELLINGHOFF: I'd be happy to.

7 Thank you, Mr. Chairman. Thank you all panelists. I really
8 appreciate your remarks and you've provided us with some
9 good information this afternoon.

10 I'd first like to explore some generic areas and
11 then I'll get into some specific questions related to your
12 testimony. The first one would be do any of the panelists
13 see that instituting conditional firm is way to efficiently
14 use the grid is at all unfeasible? Does anybody see it as
15 unfeasible?

16 (No response.)

17 COMMISSIONER WELLINGHOFF: I get no answers. I
18 assume that everybody agrees that it is feasible. Let me
19 ask that same question then with respect to redispatch and
20 I'll exclude Bonneville because I understand your answers
21 with respect to redispatch and your particular system. Does
22 anybody see redispatch as unfeasible?

23 Mr. Furman?

24 MR. FURMAN: I think that redispatch has some
25 challenges that conditional firm does not. How do you

1 access the cost? That's something that needs to be worked
2 through and I know, for example, when I was in the
3 transmission business, we struggled with how to implement it
4 under the current Order 888, so this is a good discussion to
5 be had because I think the reason you haven't seen
6 redispatch emerge is because it's not clear how to implement
7 it or how the Commission necessarily wanted it implemented.

8 It is feasible but it is something that I think
9 we have to nail down exactly what the rules are going to be.
10 And I would also add, if it is after the fact pricing,
11 that's not going to have much of a benefit. It will have
12 some benefit to the operational efficiency of the system.
13 It's not going to do anything to get new generation built,
14 wind or other. For that you need more certainty and more
15 ability to plan.

16 COMMISSIONER WELLINGHOFF: Thank you, Mr. Furman.
17 Mr. Lucas, I think you're reaching for your
18 microphone.

19 MR. LUCAS: I did, Commissioner. I wanted to say
20 it's hard to refute. You can't really that the requirement
21 to consider redispatch option in offering service today is
22 already in the tariff. So there's no real change there.
23 The provider, though, is afforded two protections in
24 evaluating that service, whether it would impair or degrade
25 reliability of service to other firm users or degrade other

1 firm uses of the system. I think you've got to keep those
2 protections for the provider because, as I pointed out, if
3 you're only looking at the providers resources, the provider
4 is likely not going to have a surplus amount of capacity at
5 peak that he can turn off and redispatch his system in a
6 different way. You would put the provider at the mercy of
7 having to go to the market and replace that capacity
8 himself. So I think in my comments I made on the panel I
9 was trying to illustrate to the Commission that's some of
10 the shortcomings of why I think you don't see more
11 redispatch being offered today is providers just don't think
12 that they can accept the risks of not impairing reliability
13 of service to others.

14 COMMISSIONER WELLINGHOFF: Actually, let me
15 follow up on that because that was another specific question
16 I had for you with respect to your testimony. Would you see
17 it possible then to provide redispatch conditionally upon
18 the reliability constraints? In other words, you could
19 probably spell those out at what points you'd have to invoke
20 those and so forth.

21 MR. LUCAS: Excellent question and in fact, it's
22 done today. In the planning models the way the system is
23 planned, you stack all your firm commitments and all the
24 load of the network native load customers. There's a
25 cushion there then built into the system that allows the

1 provider in real time to manage reliability with just a slim
2 cushion of resources that he might redispatch. And in fact,
3 today a number of providers are dispatching in real time to
4 avoid curtailments. So it's taking place. The reliability
5 tool that's in the toolbox is being used.

6 If you force, in the planning process, a
7 requirement to say carve out a requirement to offer
8 redispatch, you're going to take that reliability tool away.

9 COMMISSIONER WELLINGHOFF: So your companies
10 actually are using redispatch in your operations today?

11 MR. LUCAS: Yes, Commissioner. Every day.

12 COMMISSIONER WELLINGHOFF: Are you relying on
13 that redispatch and planning for native load?

14 MR. LUCAS: No. There's a difference. We do not
15 integrate new network resources on the assumption that we
16 can redispatch around a problem. The reason we don't do
17 that we have to attest to our states that that capacity is
18 certifiable, just and reasonable. It will be there to serve
19 the load at all hours. We cannot assume that there is some
20 redispatch combination we can use to work around to run that
21 resource.

22 Now that's not to say we don't have operating
23 guides, operating procedures. We can take lines out of
24 service. We can switch, configure lines. We do that with
25 respect to conformability. We do it for our resources. We

1 do it for transmission customer resource. We don't
2 discriminate.

1 Mr. LUCAS: -- not to integrate a firm network
2 resource that we've certified to a state commission. We do
3 not.

4 COMMISSIONER WELLINGHOFF: Okay. Let me ask a
5 question with respect to some commenters have -- no, let me
6 ask another one first. Assuming that you consider both
7 conditional firm and redispatch to be feasible products to
8 offer, excluding Bonneville and the Redispatch, did any
9 panel members see those as mutually exclusive, or are they
10 things that both products could be offered on a system? Mr.
11 Lucas?

12 MR. LUCAS: I'll answer it, yes. As I said, I
13 think the commitment to offer the redispatch as a solution
14 for a transmission constraints already exists. It's hard
15 for me to define that as a product. I think it's an
16 existing requirement and it needs refinement.

17 The conditional firm, I think, is a viable
18 product if you can work out the conditions between customers
19 and providers. As a provider, if we can be comfortable that
20 the conditions that are there that we can hand to the
21 operator in real time and have him manage not just one or
22 two transactions; he may be having to manage 10 or 20
23 transactions.

24 If we can give him the tools, if we can give him
25 the conditions, there can be predictability and certainty

1 and about it, we would want to offer the service and get the
2 revenue. I mean we would not -- our threshold would be make
3 sure we don't impair reliability in creating the product.

4 COMMISSIONER WELLINGHOFF: I saw you, I think,
5 sort of nodding your head when Ms. McIntire was talking
6 about a stakeholder process to determine these criteria.
7 Would you agree with the criteria that Ms. McIntire made?

8 MR. LUCAS: I applaud the suggestion. I think
9 the Commission has done that in similar outreach workshops,
10 and I think there should be follow-up, and there should be -
11 - there should be -- don't be too prescriptive about the
12 conditions in certain areas of the country.

13 There may be a need for flexibility in how you
14 define those conditions. Tying it to hours, we struggled a
15 bit with that. An ability of a planner to project how many
16 hours of conditional firm might be there five years in the
17 future, it's just like me trying to throw a dart at a wall
18 with my eyes closed.

19 I mean I don't know that that's going to be
20 valuable information. If I can give load levels, if I can
21 give months of the year, customers will then know we can
22 provide information that would show the load is growing. You
23 can look at load profiles in prior periods. You'll have a
24 much better feel for do I need to go to the market and get a
25 hedge resource, etcetera, to back up that. The provider

1 will be giving you more warning I may have to call on the
2 conditions that go with this service.

3 COMMISSIONER WELLINGHOFF: And let me get to this
4 issue about information or perhaps conditional firm in part,
5 but maybe more importantly for the potential for redispatch.

6 I know some commenters have suggested that real
7 time dispatch be made transparent. Is there anybody here
8 who would object to making real time dispatch transparent?
9 Mr. Lucas?

10 (Laughter.)

11 MR. LUCAS: Once more, you said "real time
12 dispatch"?

13 COMMISSIONER WELLINGHOFF: Yes.

14 MR. LUCAS: You didn't say "redispatch."

15 COMMISSIONER WELLINGHOFF: I'm sorry. I meant
16 redispatch.

17 MR. LUCAS: Okay.

18 COMMISSIONER WELLINGHOFF: Excuse.

19 MR. LUCAS: That might be a little more
20 tolerable.

21 COMMISSIONER WELLINGHOFF: I misspoke, yes. Real
22 time redispatch.

23 MR. LUCAS: Redispatch?

24 COMMISSIONER WELLINGHOFF: That's correct, yes,
25 and let me read from one of the commenter's definition here,

1 so we're all on the same page.

2 "Requires the transmission provider publish a
3 dynamic real time value of what would change -- what it
4 would charge to provide redispatch service at specified
5 congestion locations within the transmission provider
6 system, and at specified flow gates at the borders of the
7 transmission provider's system."

8 That's, as I understand it, what people are
9 meaning by transparency in a real time dispatch, redispatch.

10 MR. LUCAS: Yes. I think that needs a lot more
11 discussion and debate. To start with, if you require that
12 for the transmission provider's resources, again, you're
13 reducing some of his ability to serve native load when you
14 do that.

15 If you extend it to the market, if you say "Well,
16 you can encompass other resources in the market, you can
17 reach out to non-affiliated resources, you get back to a
18 point made on the planning panel this morning with respect
19 to operational control."

20 COMMISSIONER WELLINGHOFF: Let me stop you for a
21 second. We're not asking anybody to actually put that out
22 on the market. I'm just asking you simply publish the
23 dynamic real time value. You'd publish it.

24 I'm not saying you'd necessarily have to do
25 anything with it, you'd have to accept any values coming in.

1 I'm just saying make that transparent. That's all. Is
2 there any problem with that?

3 MR. LUCAS: And this would be a value for the
4 cost of redispatching on a particular flow gate?

5 COMMISSIONER WELLINGHOFF: Yes. Then we'd have
6 the information.

7 MR. LUCAS: Well, one of the difficulties --

8 COMMISSIONER WELLINGHOFF: I'm not talking about
9 instituting locational market pricing everywhere, I'm not
10 talking about anything like that. I'm just simply saying,
11 to get that data out there.

12 MR. LUCAS: I'm back with you. But from the
13 transmission provider's function, and I speak from the
14 transmission function for Southern Companies, we don't have
15 pricing data that we would have to use to determine the
16 price on each side of the flow gate in the transmission
17 function. We don't have that.

18 I would think it would be a serious conflict with
19 the existing standards of conduct for us to have to go into
20 our merchant function or into our generation group and get
21 costs associated with deltas of generation on each side of a
22 flow gate, and then make those publicly available.

23 I'm sure our generation arm would have some
24 concerns about the cost of generating being made public,
25 etcetera and so forth.

1 COMMISSIONER WELLINGHOFF: Thank you. I don't
2 think I have anything further. Thank you, Mr. Chairman.

3 COMMISSIONER KELLY: Don, did you have comments?

4 MR. FURMAN: Yes. I wanted to make sure that it
5 was clear. Utilities today do not just redispatch for
6 reliability purposes. They do it for commercial purposes,
7 and well they should.

8 Any economic player in the market who sees an
9 opportunity to incur a cost over here in order to make a
10 profit over here should do that. That's the way markets
11 work.

12 So it's not just done for reliability purposes.
13 It's also far from clear that any time you would redispatch,
14 you would see a reduction in reliability, whether it be
15 planning margins or otherwise.

16 The whole premise around the original Order 888
17 provision was that this would all be done within the
18 parameters of Reliability Council rules and any other rules.

19 So I don't -- I guess I disagree with the -- if
20 that's the premise that's being stated, I disagree with the
21 premise that there's necessarily degradation in reliability,
22 or that it's only being done for reliability purposes.

23 That really, the fact that it is being done for
24 economic reasons, I think, is at the crux of the problem,
25 that it's being offered to native load. It's not being

1 offered to other players in the market.

2 COMMISSIONER KELLY: Lauren, is Bonneville
3 concerned about reliability in proposing to offer or
4 agreeing that a conditional firm service would be something
5 you could offer?

6 MS. NICHOLAS-KINAS: We wouldn't expect to
7 implement a conditional firm service --

8 VOICE: Your microphone.

9 MS. NICHOLAS-KINAS: Oh. We wouldn't expect to
10 implement a conditional firm service until we had the
11 information systems in place to ensure that we could keep
12 the reliability at the level that we think is critical.

13 COMMISSIONER KELLY: And how do you determine
14 that?

15 MS. NICHOLAS-KINAS: Well, while we do share the
16 concern regarding the potential for decreasing the
17 consistency with which other firm customers would receive
18 service. So what I expect that we would do is --

19 COMMISSIONER KELLY: And explain to me how that
20 would happen?

21 MS. NICHOLAS-KINAS: Okay. Which of those would
22 you like me to answer first?

23 COMMISSIONER KELLY: Explain to me how the
24 consistency of their receiving firm service would be
25 decreased by someone else getting conditional firm?

1 MS. NICHOLAS-KINAS: Okay. So again, I'm
2 speaking within the framework of how we are thinking about
3 the product, which is largely in terms of we would define
4 some specific number of hours in the months in which we did
5 not have long term ATC available over the flow gates that
6 were necessary for that request.

7 So if we erred and defined that too generously,
8 what would happen potentially is that we would have more
9 curtailments, where in reality the conditional firm service
10 customers should be cut, in the same manner as the network
11 service customers. But we would run out of those hours and
12 therefore have to cut them as firm customers.

13 Because it's basic math, it's a zero sum game, we
14 would then end up doing either more curtailments or more
15 curtailments and more megawatts on those existing firm
16 customers as a result potentially. So that's the concern
17 we're trying to mitigate there.

18 COMMISSIONER KELLY: And okay. So I understand
19 that. So you're saying that at any point in time, there's a
20 potential of curtailment of firm customers? If you have a
21 conditional firm customer also taking at that time, it might
22 increase the likelihood?

23 MS. NICHOLAS-KINAS: Yes.

24 COMMISSIONER KELLY: So if the conditional firm
25 customer is not going to be cut first, if there's a

1 curtailment during the time that I don't actually long term
2 firm ATC to offer them, so if they are not curtailed first,
3 then they're going to be curtailed in the same bucket with
4 the rest of the long term firm customers.

5 The inherent implication there is there's more
6 megawatts flowing over that flow gate and therefore I have
7 to make a larger cut, and there would be additional
8 instances most likely where I would have to do a firm cut,
9 where just non-firm or secondary NT cuts might have
10 otherwise sufficed if those hours were correct?

11 MS. NICHOLAS-KINAS: Uh-huh.

12 COMMISSIONER KELLY: Can we use numbers? Let's
13 say that you can send 200 megawatts across a line.

14 MS. NICHOLAS-KINAS: Okay.

15 COMMISSIONER KELLY: And let's say that you have
16 it contracted for 200 megawatts, but it's only used one hour
17 a day, the 200 megawatts.

18 MS. NICHOLAS-KINAS: Okay.

19 COMMISSIONER KELLY: And that's non-peak. The
20 rest of the time of the day, it's only used 120 megawatts.
21 So are you saying that if you had 80 megawatts available
22 conditional firm during that day except for that hour, and
23 you gave that 80 megawatts out in conditional firm, why does
24 that change the reliability of the line?

25 MS. NICHOLAS-KINAS: So that's not changing the

1 reliability of the line. That's changing the impact on the
2 other existing firm customers.

3 So their experience with curtailments is likely
4 to increase if I define that 80 incorrectly, or if I -- if
5 the one hour is actually two hours, for example.

6 COMMISSIONER KELLY: Okay. But it wouldn't
7 decrease otherwise? I mean it wouldn't decrease except if
8 you define the off peak. Okay. So when you decide whether
9 to make conditional firm available for off-peak, what
10 process would you go through?

11 MS. NICHOLAS-KINAS: So we calculate our ATCs for
12 each of our flow gates on a monthly basis. So we have one
13 member for all of the hours in each month. We would, when a
14 request comes in for this POR to that POD, we determine how
15 many megawatts are necessary on each of those impacted flow
16 gates.

17 If we found that on one of those flow gates that
18 was necessary to grant that request, we only had ten months
19 of long-term firm ATC available, we would then, you know, on
20 our system we would look at probably trying to define those
21 two months as conditional firm.

22 We would then, and I'm hypothesizing here a
23 little bit, because we've never tried to do this, but then I
24 expect that we would go and we would look at historical
25 curtailment experiences in those two months specifically, to

1 try to determine what we think is a reasonably conservative
2 number of hours that we would need that would keep our
3 existing customers reasonably in the same position that
4 they're in today, and still allow us to provide the
5 potential customer with some economic certainty of what that
6 transaction would mean to them if they accept it.

7 COMMISSIONER KELLY: Okay, and if you come up
8 with a number greater than zero, then would you make it
9 available as conditional firm?

10 MS. NICHOLAS-KINAS: Under what conditions?

11 COMMISSIONER KELLY: If there is -- if you think
12 that it could be done, then would you make it available?

13 MS. NICHOLAS-KINAS: Assuming that the proper
14 systems were in place to allow us to administer it in a way
15 where we actually could manage it properly, yes.

16 COMMISSIONER KELLY: Okay. So you would pretty
17 much be able to know in advance whether you'd have that
18 product available to sell or not, if you modeled your system
19 correctly and were conservative about reliability standards?

20 MS. NICHOLAS-KINAS: So because of the way that
21 our system is very networked and we have multiple flow gates
22 and each request essentially impacts multiple flow gates, we
23 would need to examine each specific request to see whether
24 they were in the position, first of all, of needing that and
25 then whether or not we could offer conditional firm, and the

1 terms that would then be associated with that.

2 I do want to highlight the need to maintain some
3 flexibility in the terms that we would apply to that, and
4 then allow the customer to decide whether those conditions
5 would provide them with an economically viable transaction
6 or not.

7 COMMISSIONER KELLY: Does anybody provide
8 conditional firm yet now?

9 MR. LUCAS: Commissioner, we've done one
10 experiment with it, and it was based on a particular
11 transaction in a load and generation pocket in our system.
12 It was a four-month experiment across the summer.

13 It would say it was somewhat successful. The
14 customer knew the conditions; we put additional visuals for
15 them on OASIS so they could know the balance of load and
16 generation where they might be curtailed.

17 Again, I think it's just a caution. As Lauren
18 said, if we determine the conditions in a planning
19 laboratory, and then we hand that off to the operator, I
20 think it's just a -- it's a tricky balance, then. Okay, the
21 operator, certainly he could do it for one or two
22 transactions. I don't think that's anybody's running scared
23 from that.

24 But if there are ten or twenty transactions with
25 different hours, maybe linked to different constraints

1 around the system, I think it would be nearly impossible for
2 the operator to manage. I don't know what tools he would
3 use to do that.

4 MS. ALEXANDER: Another example of where a
5 version of conditional firm has been provided for is a
6 special protection system for a generator. Often, a
7 generator will not be able to get firm service out from its
8 facility to the full amount of its capacity.

9 But if it could be monitored so that the
10 generator can be turned off within a certain number of
11 minutes after the contingency arises, then firm service
12 could be provided at a greater amount, and there are
13 definitely generators in this country that operate with
14 SPSs, and get the benefit of this increased transmission
15 capacity. The systems are set up to curtail it within the
16 reliability criteria time frame, so that all the NERC
17 standards are met. In a sense, it's a form of conditional
18 firm service.

19 COMMISSIONER KELLY: Does NERC allow this?

20 MS. ALEXANDER: Oh yes, yes.

21 COMMISSIONER KELLY: Okay.

22 MS. ALEXANDER: They have standards built around
23 SPS systems, special protection systems, specific standards
24 built around them.

25 COMMISSIONER KELLY: Can those same standards be

1 adopted to conditional firm?

2 MS. ALEXANDER: I think in some instances,
3 conditional firm would be similar in a sense that it's
4 contingency-defined. The one I'm describing is that you
5 have a limiting element that you can monitor, and then have
6 a triggering that goes back -- I'm not the engineer talking
7 here, but it goes back to turn off the plant when it needs
8 to be turned off.

9 So I think in one instances, conditional firm, to
10 the extent that this condition is this kind of a limiting
11 element, could be set up in the same way.

12 MR. TAYLOR: We were -- Williams Power was
13 offered a conditional firm product, and it was because our
14 facility was located in a load pocket.

15 One of the concerns that we had that determined -
16 - that led to our decision not to take the conditional firm
17 service was that we were concerned about the transparency of
18 the data, you know, what information would be available to
19 us as the customer, so that we could foresee whether or not
20 there was a system problem actually developing.

21 So to the extent that there is adequate
22 transparent operational data available, then I think that we
23 as a customer would be more likely or more inclined to take
24 those type products.

25 COMMISSIONER KELLY: Because then you understand

1 what the risk is that you're taking on?

2 MR. TAYLOR: Well, you can actually see. If it's
3 -- let's say that it's contingency-based. Then you can
4 actually see if you have load flow data, or if you have
5 power flow data for that particular monitored element, then
6 you can see in real time as that element starts to load up,
7 you'll know that your condition is about to occur. It's
8 also a means for you to validate the existence of a problem.

9 COMMISSIONER KELLY: But you couldn't get that
10 data?

11 MR. TAYLOR: We had inquired about that type of
12 information prior, and our internally our people were
13 uncomfortable, because we had been unsuccessful in getting
14 that type of transparency previously.

15 COMMISSIONER KELLY: Would having that type of
16 transparency be important if conditional firm service were
17 available?

18 MR. TAYLOR: I think that with any type of
19 conditional firm service, whether you're limited based upon
20 the number of hours or if you're limited based upon the
21 terms of a particular contingency, whatever the condition
22 is, the more information that's made available to the
23 customer at the time that he's issued the service or offered
24 the service, the more comfortable the customer will be in
25 terms of whether or not he can assess the risk of assuming

1 that service.

2 MR. FURMAN: Commissioner Kelly had something. I
3 think this gets to one of the reasons why Ms. McIntire's
4 suggestion about having guidelines and some flexibilities is
5 probably important, because I think there are going to be
6 instances where, for example, both the customer and the
7 transmission provider may be able and want to specify, for
8 example, a certain number of hours out a specific month or
9 season when the firm's not available.

10 Certainly there are instances like that on the
11 grid where you can see that, you know that, and it's more
12 certain, and then both parties can sort of cut off the tails
13 of their risk and say we know what this is going to be
14 inside.

15 I think there are going to be other instances
16 where it's more akin to what Pat was describing from a
17 reliability standpoint, where you need to have a
18 contingency-based thing.

19 But I think that we'll be more successful with
20 this if we can have some degree of flexibility to address
21 different sort of situations.

22 COMMISSIONER MOELLER: I'd like to talk to my
23 colleagues from the Northwest. I think in terms of giving
24 this maybe a little bit of recent historical perspective,
25 Natalie, Don and also Lauren, can you talk a little bit

1 about how this evolved, the request to Bonneville about the
2 conditional firm and what kind of came out of that? I think
3 that might be instructive.

4 MS. McINTIRE: Well, the concept of conditional
5 firm, I'd have to say, did not originate with R&P or
6 necessarily with Bonneville, I don't believe, but with AWEA,
7 at least from our perspective, working with AWEA as
8 colleagues. You know, they encouraged us to be talking with
9 our transmission providers in the Northwest.

10 So we were talking with Bonneville about that
11 possibility, because their system is very constrained on a
12 contractual basis. They have a very long queue, hard to get
13 transmission service there. So we encouraged them to look
14 at this possibility.

15 It took a while before that became an open
16 dialogue, but then Bonneville began, what they call I
17 believe, a new product process, something like that.

18 So R&P, working with Bonneville, got to be sort
19 of the first effort going through that to discuss through
20 this sort of open process a new product and gather
21 stakeholder input and modify that proposal and we had a very
22 good working relationship with them, I think. Like I
23 said in my comments, we think the product is very viable,
24 and the holdup that I understand there, and maybe Lauren can
25 speak to it a little bit more, is this lack of computer

1 systems in order to implement this type of product, where
2 you need to be able to curtail certain contracts on the
3 network before you can curtail others.

4 That's not a possibility right now. But should
5 it evolve and those systems be developed, they seem
6 interested in pursuing it.

7 MR. FURMAN: Just before I launch, I have to say
8 Bonneville, what we do a lot of business with Bonneville on
9 the transmission side, and they are a very good counterparty
10 to do business with. They work hard at fulfilling their
11 transmission obligations.

12 You know, we don't have a specific conditional
13 firm discussion going on right now that I'm aware of. That
14 could be completely wrong, but it happens. But I think that
15 there is -- what is definitely true about the Northwest is
16 that you don't have --

17 You know, because systems always have -- I mean
18 let's think about this. Ten, fifteen years ago before 888,
19 everybody ran their generation of transmission together.
20 Everybody sat in the same room. Everybody was able to
21 jigger this up and jigger that down and make this get over
22 here and move that over there.

23 To some extent, 888 both required them to do for
24 everybody else, but also made it a little bit harder to do
25 that because of the code of conduct. The RTO West/Gridwest

1 experience was that in fact, Bonneville has sold more
2 transmission then, if you just look at it as a static
3 system, they could deliver.

4 So actually Bonneville does redispatch in their
5 system in order to meet their existing transmission
6 obligations. You could call that planning for -- using
7 redispatch for planning purposes, although I don't think
8 that was an overt decision.

9 Certainly Bonneville has a lot of things coming
10 at it. Between Judge Redman's fish decisions and you know,
11 it is a complicated system and so on and so forth. But I
12 think that over time, as we work on these things, there's a
13 great capability for that agency to implement some of these
14 tools.

15 I think both just because of the attitude of the
16 institution but also, I think, they've got -- they have the
17 ability to do it.

18 COMMISSIONER MOELLER: Lauren, again to follow
19 up, I think Bonneville learned a lot, from what I've heard,
20 out of that process as well. I'd be curious on your
21 reactions to that and how it might apply to efforts in other
22 regions.

23 MS. NICHOLAS-KINAS: First, I want to
24 respectfully disagree with Don. When we're doing an ATC
25 analysis for a specific request, we in no way examine

1 whether redispatch can be used to grant that request.

2 In terms of our internal process, in looking at
3 whether we could develop a new product that got the name
4 conditional firm, we first started by really looking at our
5 inventory and how we might be able to define a different
6 kind of inventory with different characteristics, to squeeze
7 more out of the existing transmission system.

8 So we did that by examining data for each of our
9 flow gates, and looking at an essentially below duration
10 approach. We found that on our system, the flow gates tend
11 to take a shape where just a very few hours of the year,
12 there's a steep drop, or a very high level of flow and then
13 there's a steep drop, and then it becomes relatively flat
14 for most of the hours of the year. Then there's a steep
15 drop for a few more hours.

16 So in looking at what inventory we had, we're
17 looking at that space between the ATC and the bottom of the
18 steep drop essentially, as something that would be viable to
19 try to sell in some different manner.

20 So the real challenge then becomes, I think, for
21 us as an industry to define it in a manner that has
22 characteristics that we can essentially have some meaningful
23 level of consistency, but that we don't take the flexibility
24 out for our system or someone's system who looks vastly
25 different than ours. I think that is one of our fundamental

1 challenges.

2 The second issue that I want to just point out is
3 that in talking about conditional firm, I think we're all
4 kind of describing different pieces of an elephant perhaps.

5 We don't have at this point a clear picture of
6 what that might be on a nationwide level. So I do agree
7 with Natalie, that it would be useful to put some more time
8 in, in working to develop that as a larger group.

9 COMMISSIONER SPITZER: Thank you. This is John. I'm
10 interested from a global perspective in integrating wind
11 energy, and we do have this dilemma. Mr. Lucas spoke about
12 speculation, five or ten or even 20 years out, and the
13 complexity in attempting to make projections to comport with
14 the conditional firm.

15 With regard to perspective projects, the
16 developers need financing and those who provide financing
17 are looking for some degree of certitude. So we have the
18 chicken and egg formulation.

19 I've read the materials and we have a conflict of
20 opinion, and I'm not sure how we resolve that. I'd like you
21 to comment on that general issue.

22 Then, on a more specific point, to modify a bit
23 Commissioner Kelly's hypothetical, in her hypothetical, she
24 used the term "a conservative projection" for what would be
25 available. It seems to me under the status quo, and I'm

1 appreciative of Bonneville's efforts to move forward and
2 accommodate the intermittent users.

3 But there don't seem to be any incentives to
4 avoid overly-conservative projections, that would understate
5 what would be available for a prospective developer looking
6 to finance a project.

7 So what can be done? There don't seem to be any
8 incentives on the other side. I respect the need for
9 reliability, but it seems like we have a system that's kind
10 of out of balance. We seem to have a -- the incentives
11 would appear to be tilted against the wind developers.

12 MS. McINTIRE: I just want to point out briefly
13 that we have never really thought of this product as
14 specifically for wind or for renewable resources, but for
15 all generators, or all transmission customers, for that
16 matter.

17 We do think it is a viable product for wind. But
18 I think you pointed out a really good point, that there
19 needs to be transparency here also.

20 In the workshop that we had in 2005, there was a
21 lot of concern on the part of some customers and some
22 transmission providers that within those conditional months,
23 where there was no firm ATC available, then all hours needed
24 to be considered potentially curtailable at this less than
25 firm priority.

1 I think that there is a reasonable place between
2 all hours and an exact number. I think it is unrealistic
3 for a transmission provider to be able to say "next year I
4 know that exactly this is the number of hours" or in five
5 years or in ten years.

6 But I think that there is a reasonable way to get
7 to some number that is conservative, and protects firm
8 customers, but also gives certainty to new generators.

9 Just sort of as a high level conceptual way to
10 think about this, most transmission providers would tell you
11 we're not going to need to do this in the low load hours, so
12 we can cut those hours out of the month.

13 We've got then our high load hours, and there's
14 no -- we're not going to have an adequate system, we're not
15 going to have a reasonable system if we feel like we need to
16 curtail secondary network customers, all of the high load
17 hours in these two months. That would not be an adequate
18 system to meet all the transmission needs for the market.

19 So what number in there can we come up with,
20 that's between, you know, five or ten hours and all the high
21 load hours, that's reasonable.

22 But I think that it needs to be a transparent
23 process to come up with that conservative number, so that
24 the transmission provider should say this is why we think we
25 need, you know, this amount of buffer, and this is the

1 historic numbers that we have to work with.

2 COMMISSIONER SPITZER: So there's some
3 objectivity attendant to that conservative determination?

4 MS. McINTIRE: Right, yes. We're not going to
5 get an exact number. I think that that would be
6 unrealistic.

7 COMMISSIONER KELLY: Is this a NAESB kind of
8 issue, or is this a system by system issue?

9 MS. McINTIRE: I am not familiar with all the
10 work of NAESB, so I'm not the one to answer that question.
11 Maybe someone else can.

12 MR. LUCAS: I can, Commissioner. I've been on
13 the NAESB Executive Committee and now sit on the NAESB
14 Board. I don't see that as an issue to hand off to NAESB.
15 NAESB is business practice standard-setting.

16 It would need to be clearly defined in terms of
17 what is the business practice that would be needed to
18 address Mr. Spitzer's question of the right incentives to
19 prevent conservative estimates on conditions. I don't see
20 as a NAESB challenge.

21 MR. FURMAN: I'm a lawyer by training, and have
22 just enough electrical engineering to be dangerous. I think
23 the conservatism that you see -- you do see a lot of
24 conservatism in the design and the operation of the system,
25 and that's a good thing.

1 That's one of the reasons we have such a reliable
2 grid in this country as opposed to other places. I'm sure
3 you've been places where the lights go out.

4 However, it's also true that there is an
5 incentive built into the system for conservative behavior,
6 and you know, I understand this, because I've been on that
7 side. Utilities don't get compensated to
8 take risks, you know. It's a rate of return kind of
9 business, regulated rate of return business. So utilities
10 do have an incentive to hold on to flexibility and just
11 general, I guess, excess capability in the system, because
12 that reduces their risk.

13 Certainly you saw that in the Western energy
14 crisis, when you know, utilities did let reserve margins get
15 too low and when transmission didn't get built. You had,
16 among other reasons for all of that, I think, was the lack
17 of adequate capability. So we want to make sure that we
18 don't go too far in doing that.

19 But conditional firm and redispatch both
20 recognize that, and they seek to -- conditional firm seeks
21 to carve out that piece that really isn't needed for that
22 redundancy and that reliability.

23 Similarly, redispatch seeks to find places in
24 which the economics of the situation dictate that it's silly
25 to hold all that stuff there. We can go buy it some place

1 else and rejigger things and create more value for society.

2 So I guess I appreciate Commissioner Spitzer's
3 comments. I think they're right on. We just need to have a
4 full view of all the factors that go into that conservatism.

5 COMMISSIONER KELLY: How would we make the
6 decision about whether or not it would be important or
7 worthwhile to require utilities to considering offering
8 conditional firm?

9 MR. FURMAN: Well, I mean, first of all, the
10 reliability criteria are already there. They're
11 established. As long as we stay within those, I don't think
12 there's anything at all to say that you shouldn't require --
13 and again, I agree that there needs to be some flexibility.

14 You would want to do it with guidelines. But
15 require subjective guidelines and with some flexibility and
16 room for negotiations for utilities to do that. I think
17 that's what we're here. I think that's definitely how we
18 feel.

19 COMMISSIONER KELLY: I guess the downside is the
20 cost involved in having the utility look into that.

21 MR. FURMAN: But I don't think the cost is
22 extraordinary. I mean, what you're using -- look. First of
23 all, you're looking at system studies that are predominantly
24 already being done. You're looking at the kinds of
25 operations that are predominantly already being done.

1 And so it's incremental cost and in the grand
2 scheme of things, I don't think that cost is considerable.
3 As long as we're not talking about the specific redispach
4 cost. I mean those redispach costs may be considerable,
5 and in that case you won't do it.

6 You're looking for those instances where for
7 relatively little cost you can rejigger operations to create
8 some capability.

9 COMMISSIONER KELLY: Thanks.

10 MR. LUCAS: Commissioner, I'm sorry. My mind
11 just went blank on the point you had raised. I had it
12 there. I lost it for just a minute when Don started
13 talking.

14 One thing I did want to go back to Commissioner
15 Spitzer's comment, and maybe it will float out to the front
16 of my mind. Incentives to prevent conservative projections.
17 To me, the biggest one that's in the tariff today is, the
18 way the Commission's proposed it, the provider gets to
19 collect the full rate for the transmission service.

20 So I don't think I'm going to keep customers very
21 happy long if I'm taking the full transmission rate and not
22 sticking to -- pretty closely to the projection on the
23 conditions that were given. I think that's the strongest
24 incentive.

25 Another strong disincentive is that I don't think

1 conditional firm should be considered at all unless it's a
2 bridge mechanism to get transmission built to relieve the
3 constraint. I just don't think we ought to create a market
4 that's centered around just conditional firm, because you
5 won't get new infrastructure.

6 If a provider gets a request, and conditional
7 firm's not there, and he doesn't have the capacity in the
8 system, he wants to build that capacity out subject to the
9 appropriate pricing and cost recovery. So I think that's
10 the incentives.

11 COMMISSIONER SPITZER: Mr. Lucas, I absolutely
12 agree with respect to existing generation, both comments;
13 one on remuneration for the service. You get paid the fair
14 dollar or what Mr. Wellinghoff said a few hours earlier, and
15 with respect to the relieving a constraint.

16 But with regard to prospective introduction of
17 intermittent resources, you don't have the compensation
18 issue. You're looking -- the generator, the developer is,
19 with gimlet eyes, looking over projections. If the numbers
20 don't pencil out, the project doesn't get built, based on
21 variables outside the control of people proposing to build.
22 So there's a degree of frustration.

23 Then secondly, you don't want to overbuild. I
24 mean Lord knows we need enough transmission. We have to be
25 in the right place. Where there is an underutilization of

1 the existing grid, it would be bad policy to require
2 duplicative transmission to meet 20 hours, you know, or five
3 hours or whatever in, you know, a 365-day year.

4 So we might -- a consequence of your position
5 might be to overbuild where it's not necessary.

6 MR. TAYLOR: Yes, Commissioner. In terms of your
7 question concerning what would it take or to offer or to
8 institute conditional firm service from a study perspective,
9 as Don said, right now the study's already being done.

10 When a customer requests transmission service,
11 then if the ATC is unavailable, then the provider's going to
12 -- if the customer requests, then the transmission provider
13 will conduct a system impact study, and as a part of the
14 results of that impact study, the provider will identify
15 what the limiting elements are or what the limiting
16 constraints are.

17 So in terms of providing a conditional firm
18 service, it's just a matter of that provider saying that
19 under these sets of restrictions or projected restrictions,
20 I can provide you the requested capacity, unless these
21 events occur.

22 Then it's a matter of is that service provided in
23 terms of the occurrence of that contingency, the hitting of
24 some threshold load level, or some restricted number of
25 hours of operation.

1 So from that standpoint, the data has already
2 been compiled. Would you agree gentlemen?

3 Secondly, in terms of whether or not the service
4 should be provided as a bridge service or whether it should
5 be provided to any and all customers, from a transmission
6 customer perspective, it may not always be economically
7 feasible for the customer to pay for the upgrade or the time
8 may not be sufficient for the upgrade to be implemented.

9 COMMISSIONER KELLY: So as a customer, you might
10 be very happy with the service?

11 MR. TAYLOR: Yes.

12 COMMISSIONER KELLY: And what use would Williams
13 Power put that kind of transmission product to?

14 MR. TAYLOR: If we have a, say a long term -- if
15 we have a customer that we'd had for say, something less
16 than the required amount of time, to actually build the
17 upgrade, let's say it would take five years to construct the
18 upgrade, but we only have a three-year contract with the
19 customer.

20 If we request the capacity and the capacity's
21 unavailable for the length of period or the length of
22 priority that we need to serve that customer, but for a
23 specific occurrence of a certain event or a specific number
24 of hours, we may be willing to take the risk on that
25 conditional firm service, just for that specified period of

1 time, knowing that if this event were to occur, then we as a
2 marketer would have to scramble and cover that contingency.

3 As a customer, as a marketer, what we do is risk
4 mitigation. So it's a service that we can use to not only
5 meet our existing conditions, but also to allow us to meet
6 the conditions of other customers and provide a competitive
7 product.

8 COMMISSIONER KELLY: Thank you.

9 CHAIRMAN KELLIHER: I wanted to ask Mr. Lucas
10 about redispatch. Do you currently offer redispatch?

11 MR. LUCAS: Mr. Chairman, we do evaluate
12 redispatch when we get a request for transmission service,
13 if we've run across a circumstance where there are -- we
14 determine when you run a transmission planning model against
15 a request, you do so at various load levels. You don't do a
16 planning model for 8,760 hours a year, but you pick some
17 typical loads.

18 If we find a constraint, at the system study we
19 would indicate there's a constraint. When we go to the
20 facility study, we would then find the solution for that
21 constraint and see if we had capacity available in our
22 generation fleet that we could not operate and free up the
23 contingency.

24 Again, some of the difficulties I pointed to
25 earlier, reserve margins are slim and the bigger thing is

1 the provider may in fact or any generator may in fact have
2 to -- if you want 100 megawatts of opposing flow on a flow
3 date, you may in fact have to redispatch hundreds of
4 megawatts to get that 100 megawatt change of flow.

5 CHAIRMAN KELLIHER: So from the generator's point
6 of view, in seeking service, when you do your redispatch
7 estimate of some kind, is it that you can't -- the reason it
8 might not be appealing from the generator's point of view is
9 that you can't estimate how many hours of redispatch might
10 be required or you can't estimate in advance what the cost
11 would be?

12 MR. LUCAS: I think it would be both. You mean
13 in terms of the challenge for the provider?

14 CHAIRMAN KELLIHER: Right.

15 MR. LUCAS: I think it would be both.

16 CHAIRMAN KELLIHER: You'd be saying we could
17 accommodate you, we could redispatch, but we can't tell you
18 how many hours or what it would cost you?

19 MR. LUCAS: Well, no. I think it's back to --
20 the challenge is already there today to offer the service.
21 I don't think the challenge will change for the providers of
22 are you going to be able to do that without impairing
23 reliability.

24 The new requirement in the NOPR would be that as
25 we evaluate that, we give an estimate of the cost and the

1 hours. If we're able to do it, we would find a way if that
2 was the final determination in the NOPR to give a projection
3 for the cost and the hours.

4 CHAIRMAN KELLIHER: Well, when you say that --
5 okay, I don't want to confuse it with the bridge and
6 conditional firms. Let me try to finish redispatch. I
7 guess that was my question. Do you offer it -- well, let me
8 ask the generators.

9 Is redispatch offered to the generators, and is
10 it unappealing because of the uncertainty about what the
11 cost would be? Is it the estimate, the lack of an estimate
12 that makes it unappealing, or is it not generally an option
13 available to you?

14 MR. TAYLOR: To my knowledge, it has not been an
15 option that was generally available from a generator
16 perspective. Going back to when I was on the provider side,
17 at Entergy we did attempt to offer redispatch service to
18 some customers who requested it, and we did not get very
19 many takers because they were afraid of the cost.

20 They were afraid -- well, at that time, we did
21 not give them all of the details concerning the contingency.
22 So they were more concerned about the cost side of it.

23 CHAIRMAN KELLIHER: But there seems to be a
24 question about how uncertain the costs are. At least Ms.
25 Alexander doesn't think the costs are that hard to estimate,

1 based on your paper --

2 MS. ALEXANDER: Calculate.

3 CHAIRMAN KELLIHER: Calculate. Would you say in
4 many cases the cost of making longer-term service available
5 using redispach service would not exceed the average OATT
6 cost rate?

7 MS. ALEXANDER: We in essence, certainly in our
8 comments, put in an example, a numerical example of kind of
9 the difference in the magnitude of estimated redispach cost
10 with a measure of error. You can build in a measure of
11 error, not coming close to the cost of expansion.

12 If you're looking at a long-term transaction, if
13 the customer's going to be paying the OATT rate for 20
14 years, then it's going to take an awful lot of redispach
15 cost to start having to bump up against that rate.

16 I would agree that estimating redispach costs is
17 a challenge. Calculating and verifying them shouldn't be,
18 you know, on a real time basis.

19 CHAIRMAN KELLIHER: Verifying them after the
20 fact?

21 MS. ALEXANDER: Uh-huh.

22 CHAIRMAN KELLIHER: Let me ask about the bridge,
23 the bridge conditional firm. A couple of you have used
24 that. I think Ms. McIntire and Mr. Lucas both said
25 conditional firm should be a bridge. No? Didn't? You did.

1 I have it right here.

2 (Laughter.)

3 MS. ALEXANDER: I said it could be a bridge.

4 CHAIRMAN KELLIHER: Could be, right. You did say
5 "could be," not should be. Mr. Lucas, I guess, said it
6 "should be."

7 MR. LUCAS: Yes.

8 CHAIRMAN KELLIHER: Are you saying it should be
9 linked to some commitment to pay for the upgrade?

10 MR. LUCAS: No, no, Mr. Chairman. Not linked to
11 a commitment to pay for the upgrade. Linked to long term
12 firm service that is requiring the upgrades. In other
13 words, if the ATC is there, they should get the service.

14 It shouldn't be conditional. If we can't provide
15 the service but for an upgrade being built, then that to me
16 is the platform we should use for this conditional firm
17 product. It's in connection with improving the system, so
18 that next time around it won't have to be conditional.

19 CHAIRMAN KELLIHER: Ms. Alexander?

20 MS. ALEXANDER: And we think that many times that
21 may be the case, that it is a bridge, long term transaction
22 where expansion is the right economic choice, it should be
23 built into the plans at some point when it becomes the right
24 economic choice and the Commission's pricing will sort it
25 out.

1 But it will often be the case that it will --
2 expansion would never be the real economic choice. I think
3 Commissioner Spitzer gave you an example of, you know, if
4 it's only a few hours of redispatching, it's a minor cost
5 and expansion is quite expensive.

6 It wouldn't be prudent to expand whether you're
7 doing that for a native load or for your OATT customer, and
8 we shouldn't take that off the table and have a rule that
9 says it's only available for bridges. I mean I just don't
10 get the sense of that.

11 MS. McINTIRE: It sounds to me like that's also
12 the case for conditional firm. Sometimes it will be a
13 bridge, but a customer might be very happy with having it at
14 a period of time, and not having it all the time.

15 MS. ALEXANDER: Yes. At the end of the day, this
16 will be an economic choice, whether to build or not. It
17 should be an economic choice whether to build or not.

18 MS. McINTIRE: I would just like to add that
19 there may be some situations where you have enough new
20 generation or new interest in transmission where you can
21 feasibly fund a whole new transmission line.

22 But there may also be cases where you just have a
23 small project, and there's no way that that one project can
24 justify that cost. But they might be willing to take
25 conditional service or redispatch over a long period of

1 time.

2 The other thing I wanted to point to is I think
3 that we have two different concepts here when we talk about
4 a bridge. One is the bridge to the time when new
5 transmission is built and you get firm service, assuming
6 you've paid to help fund those upgrades.

7 The other is a situation where you sign up as a
8 customer for conditional firm or redispatch, when there is
9 no ATC available, but at a later point maybe existing
10 customers have not taken advantage of their rollovers,
11 they've let their contracts lapse, and now there is more
12 firm ATC available, and what should you do at that point.

13 I think Bonneville has an interesting solution to
14 that, which at least the members of our organization have
15 felt comfortable with. Do you want to mention that or --

16 MS. NICHOLAS-KINAS: I'm not quite sure which
17 piece you're referring to. The way we would think about is
18 if the customer did not choose to participate in the SIF and
19 the SFS process, was given the option of just taking the
20 conditional firm service in the long-term, that they would
21 no longer be in the queue, per se, than to receive ATC that
22 a customer may not have rolled over, for example.

23 But that if there was some larger upgrade effort
24 that was open to folks, that they would have the
25 opportunity, then, to participate in that.

1 MS. McINTIRE: I think I was recalling an earlier
2 conversation that we had with Bonneville.

3 (Laughter.)

4 MS. McINTIRE: However, I think that Lauren's
5 answer is also a viable solution for many customers. But
6 Bonneville has been considering charging this product at
7 their normal long term firm rate.

8 In which case if there is firm ATC that comes
9 available at a later point, there's no incentive for a
10 conditional firm or a redispatch customer to say "No, I
11 don't want that firm ATC" and not to accept, you know, an
12 upgrade to a full firm contract.

13 So that, I think, depends somewhat on pricing.
14 But I think that that sort of a bridge is certainly a
15 possibility for both of these types of products.

16 MR. TAYLOR: To Natalie's last point, there is
17 the incentive for a conditional firm customer to upgrade to
18 a firm product if that capacity becomes available, because
19 it allows that condition to then be removed.

20 CHAIRMAN KELLIHER: I wanted to ask a question
21 about, picking up on Commissioner Kelly's analogy, that 200
22 megawatts of firm capacity, the 80 megawatts of conditional
23 firm and the one hour, and what if one hour becomes two.

24 Who gets curtailed? You just do a TLR? What
25 effect would that --

1 MS. ALEXANDER: It would be pro rata, under the
2 current NERC rules, unless you changed the rules in some
3 way.

4 MS. McINTIRE: It would be pro rata, but I think
5 you would be foolish for a transmission provider, if they
6 saw that they needed one hour, to create a conditional firm
7 product with just one hour. I think that all transmission
8 providers are going to build in a conservative buffer there
9 that's reasonable. But working with Pat's answer --

10 CHAIRMAN KELLIHER: What are numbers that
11 Bonneville might be looking at for, you know, capacity? How
12 much of your capacity might you consider offering as
13 conditional firm?

14 MS. NICHOLAS-KINAS: It's going to vary by flow
15 gate. What we'd like to have the ability to do is start off
16 relatively conservatively, look at maybe a couple of hundred
17 megawatts, get some experience with that, see how that
18 functions with the various conditions that we've put around
19 it, learn what we can because it's so new, and then move
20 forward. If it looks appropriate, maybe broaden that out.

21 So we'd like to maybe be able to take a somewhat
22 incremental approach. So the term "conservative," it's very
23 much a balancing act between we want to be able to offer
24 additional service, and we want to make sure that we're not
25 doing something that would be detrimental to the existing

1 customers on the system, or to the operations that we might
2 not have foreseen.

3 So that that balancing act does cause us to want
4 to be relatively cautious as we move forward.

5 CHAIRMAN KELLIHER: Thanks. From a generator's
6 point of view, I'm trying to grapple with the either/or,
7 both or neither kind of proposition, and I can understand in
8 a hydro-based system, your view is redispatch isn't really
9 an option, but you're exploring conditional firm.

10 But everywhere else, I haven't really heard
11 anyone, not Mr. Lucas, no one say that we shouldn't explore
12 either of these options or services, that they have certain
13 challenges, but there's no reason just to rule them out
14 altogether.

15 From the generator's point of view, is either of
16 them more attractive? I think you both, Mr. Taylor and Ms.
17 Alexander, said you like both services. You think they both
18 should be offered. But do you think one is more valuable
19 inherently than the other?

20 MS. ALEXANDER: I'd hesitate to say that, because
21 it's kind of like a "it depends" answer, that you know --

22 CHAIRMAN KELLIHER: Conditional firm will be
23 shorter term? I mean redispatch, I assume you could sign a
24 longer-term contract. But then the difficulty will be
25 estimating the hours, I suppose.

1 MS. ALEXANDER: Right.

2 CHAIRMAN KELLIHER: But it could be a longer-term
3 contract?

4 MS. ALEXANDER: Each of them comes with different
5 risks, as to who takes the risk, you know. In redispatch,
6 the risk is a dollar risk. That may be uncertain. In the
7 conditional firm, the risk is a curtailment risk that you
8 don't have to hedge around and do something with.

9 You know, the opportunities to manage those risks
10 may vary from transaction to transaction. So I hesitate to
11 say that there's a rule that says that one is always better
12 than the other, and it seems like the best thing to do is to
13 incorporate both of them as options, get the information as
14 to what can or cannot be done.

15 If both are available, then the customer can make
16 an informed decision about what best suits that particular
17 transaction.

18 CHAIRMAN KELLIHER: Mr. Lucas, from your point of
19 view, is one riskier from the transmission provider's point
20 of view than the other?

21 MR. LUCAS: I was going to ask you to be able to
22 comment, Mr. Chairman. She outlined the risks, Pat did, for
23 the generator. But for the provider, you've got the risk of
24 trying to balance the reliability of the system and not
25 being overly conservative in how many conditions or the

1 types of conditions you would put on the service.

2 I think they're both of equal risk. It's a
3 comparison of the risk of will you degrade or impair service
4 to other firm customers by redispaching your own resources.

5 I think as I look at the two prongs, I see
6 redispach more risky, because if you're only talking about
7 the provider's resources, if there's going to be an
8 expansion of the market to drawn in other resources, will
9 those resources always be available, how will be able to
10 call on them, that kind of thing.

11 To me, there's a lot more risk there and
12 questions there about how do you get that into something
13 that's viable. On conditional firm, if we could work
14 through a stakeholder process and lay out the conditions, I
15 think the analysis is going to be the same. You're looking
16 at is there capability in the wires to accommodate the
17 transaction.

18 If not, could we put conditions on it and say in
19 these periods, at these load levels, during these hours,
20 it's not available. To me, that's a much more comfortable
21 place to be if you're the transmission provider, rather than
22 having to hammer through redispach.

23 CHAIRMAN KELLIHER: From a transmission
24 provider's point of view though, wouldn't the risk of
25 redispach be less if you could redispach not only your own

1 utility-owned generation but unaffiliated interconnected
2 generation?

3 MR. LUCAS: Well, I think we'd feel better that
4 it wasn't just our own resources being called to task. But
5 I think you've just upped the complexity of having to take
6 bids and figure out which resource was needed and is it
7 available and so on and so forth.

8 COMMISSIONER KELLY: How many resources, network
9 resources do you redispatch now in the Southern System?

10 MR. LUCAS: The fleet is well over 130-some odd
11 resources. So I would imagine at any given time, all of
12 those might experience some kind of redispatch. Probably
13 some moreso than others. There will be at particular flow
14 gates or possible constrained points on system.

15 COMMISSIONER KELLY: That's a lot of resources to
16 manage now.

17 MR. LUCAS: Yes ma'am.

18 CHAIRMAN KELLIHER: Let me ask staff. Do they
19 have some good questions? They don't have to be superb;
20 they have to be good.

21 (Laughter.)

22 MS. AMERKHALL: I wanted to go back to this
23 discussion --

24 CHAIRMAN KELLIHER: Your mike on, Jennifer?

25 MS. AMERKHALL: Yes. I want to go back to the

1 discussion about the customer, the conditional firm customer
2 firming up once firm becomes available, and I think this is
3 very related to whether conditional firm is bridge service
4 or not.

5 But in certain situations, you might have a
6 conditional firm customer get service, say 100 megawatts of
7 service, and then along comes the next customer who doesn't
8 want to take conditional firm service, but is willing to pay
9 for the upgrades. What happens in that situation? Who gets
10 the firm service if the conditional firm customer has like
11 right of first refusal?

12 MS. NICHOLAS-KINAS: Well, the way we're thinking
13 about that is that that conditional customer would retain
14 its conditional characteristics, and that they would
15 probably be called upon less for conditional curtailments
16 for a time before that additional ATC -- because ATC is
17 lumpy -- actually gets sold.

18 But that additional ATC that they didn't then
19 participate in funding would be posted as ATC that would
20 available to be sold to other customers.

21 MS. AMERKHALL: Any other thoughts on that?

22 MR. TAYLOR: From a transmission customer's
23 perspective, if we were to purchase the conditional firm
24 service and some other party were to come in and actually
25 pay for the upgrades, from our perspective it's so long --

1 well, our service would remain conditional, up until --
2 well, our service will remain conditional, subject to the
3 conditions that were defined in the TSA.

4 Therefore, the customer that actually paid for
5 the upgrades or paid for the firm service, his service would
6 be firm. If at some point we decided to pay for the
7 upgrades, then our service would then graduate to firm
8 service, traditional firm service.

9 MS. AMERKHALL: But what happens if that second
10 customer in line creates firm service for you and by your
11 taking, your being first in the queue for that firm service,
12 you take away from that second customer?

13 MR. TAYLOR: I would say that we would remain --
14 again, our status would remain the same. What would happen
15 would be that the set of conditions that were identified,
16 assuming that that second customer had the same set of
17 conditions identified in their system impact study, then by
18 virtue of that second customer performing those upgrades,
19 then that second customer would lessen the likelihood of
20 those conditions actually occurring. But that first
21 customer would still be subject to those conditions if they
22 did occur.

23 MS. AMERKHALL: And the problem that you outlined
24 of the customer being first in the queue for the new ATC can
25 be handled, by not allowing them to stay in the queue if

1 they're not interested in financing a build?

2 MS. NICHOLAS-KINAS: Jennifer, the lumpy
3 investment situation that you just presented, it happens
4 today in the other order. One customer bites the bullet and
5 builds the upgrade, and it's lumpy. The next customer comes
6 along and doesn't have to build an upgrade.

7 All right. So we have that today, and I don't
8 know why we'd want to treat a customer who happened to
9 select conditional firm any differently and say because you
10 came first instead of second, you don't get the advantage of
11 the lumpiness.

12 You know, if you're going to fix lumpiness
13 generally, you'd have to fix it in all the scenarios that it
14 happens in, not just the conditional firm situation. If you
15 have an issue with somebody coming along second and getting
16 the benefit of an upgrade funded by another customer, deal
17 with that generally and apply those same rules to
18 conditional firm.

19 MR. LUCAS: Jennifer, could I -- I think you've
20 raised the perfect pricing horror that could come out here,
21 if we don't consider linking this or creating it as a bridge
22 product. I think the bridge product solves that, is that
23 the first customer in the queue, he's waiting on the
24 upgrade.

25 So there's something being built for him. If we

1 don't have that bridge feature in there, then I think what
2 you've created is if Customer 2 comes long and he drives an
3 upgrade that will firm up Customer 1's service, and the
4 upgrade would have driven the higher of pricing.

5 In other words, rolling it in would not be the
6 lower cost. I think you're going to have both customers
7 brought back to the table and spread that incremental cost
8 between the two of them. To me, that's only fair, and I
9 don't think the first conditional firm customer would be
10 very excited about that.

11 MS. McINTIRE: I think this is a challenge. My
12 sense is that Bonneville has a solution that may be
13 workable. Anthony says that as a customer, they would be
14 willing to maintain conditional firm service.

15 But I think what absolutely does not work is for
16 a customer to sign up for a conditional firm product, and
17 then five years later be told oh, you're going to have to
18 pay \$30 million or \$50 million because we're doing this
19 upgrade, and they haven't factored that into their balance
20 sheet.

21 All of the sudden their project is no longer --
22 doesn't make money. They're not going to be happy. Because
23 of that, I mean I think it's really important that this
24 could be used as a bridge product if at the time of a
25 contract, there's enough interest to build that new line.

1 Then you can say "Well, you know, we're going to
2 build this new line. Everyone's going to sign up to fund a
3 portion of it, and then we're going to have the line five
4 years down the road. But you, wind project, you're going to
5 be on-line next year, you know.

6 "You can take conditional firm service until that
7 time. But if you don't have enough interest in the line,
8 you lose the opportunity to make some use of the system for
9 that period of time."

10 You know, it may be a significant period of time
11 until you have enough interest to really fund the line.

12 MR. LUCAS: Just one quick follow-up. Natalie's
13 raised a great point. But I think the challenge here, and
14 we've got to recognize, upgrades may in fact not drive ore
15 pricing. So it may be an upgrade that could be done and not
16 rolled in and you wouldn't have the issue of customers
17 having to fund projects. They would just be paying the
18 normal transmission rate. So I don't think it always goes
19 automatically to having to fund incremental improvements.

20 CHAIRMAN KELLIHER: Great. Any other questions?

21 MR. HEDBERG: Do all the panel members agree that
22 a conditional firm product should be eligible to be
23 designated as a network resource? Are there any reliability
24 concerns regarding that?

25 MS. NICHOLAS-KINAS: We have spent some time

1 trying to think about how conditional firm or something akin
2 to that, some way to take that ATC and make it available to
3 a NT customer, could work. We have not been able to do that
4 out in a way that we would be able to answer that question
5 yes or no at this point.

6 I think that that would need maybe substantially
7 more discussion before we could come to a clear
8 understanding of whether or not that would work.

9 MR. HEDBERG: How about the flip side of that
10 question? If it is not eligible as a designated network
11 resource, is there interest in it by the wind folks or
12 Williams or a marketer or any other transmission customer?
13 Is it contingent on it being eligible as a designated
14 resource or there's no interest in it?

15 MR. TAYLOR: From our perspective, I think we're
16 interested regardless.

17 MS. McINTIRE: I think there is interest.
18 There's also the other potential, which is that using this
19 product to wheel through one transmission provider service
20 territory to get to another. Then that second transmission
21 provider, their network load, is wanting to designate it.

22 I think in that case, it really must be potential
23 for it to be designated as a network resource. I don't
24 think it's that much different than a firm contract right
25 now, which could be curtailed, you know.

1 Any network resource that has a firm contract has
2 a potential that in any particular hour it could be
3 curtailed. But that doesn't remove the possibility to
4 designate it as such.

5 MS. ALEXANDER: It also seems to me that a lot of
6 network resources aren't available 8,760 hours a year.
7 There's forced outage rates on thermal units; there's
8 intermittent resources, the wind is blowing or not. If they
9 get designated as network resources, there could be air
10 improvement issues.

11 So I mean the notion that a network resource that
12 doesn't have firm guaranteed access every hour of the year
13 shouldn't be designated as a network resource, we don't do
14 that today.

15 So there's got to be a way, if we can get
16 comfortable with the conditional firm product, that is
17 defined one, the customer's not going to take it if it's
18 going to be interruptible nine months a year. They're just
19 not going to take it.

20 That why wouldn't we let that be a network
21 resource, just like other types of network resources that
22 have these kinds of variations?

23 CHAIRMAN KELLIHER: Kathleen?

24 MS. BARRON: One more question.

25 CHAIRMAN KELLIHER: Sure.

1 MS. BARRON: One of the things I think the
2 Commission has been struggling with is if conditional firm
3 is a product in the tariff, shouldn't it have the same level
4 of detail in the terms and conditions as the other types of
5 products in the tariff?

6 So we focused on should the conditional part of
7 conditional firm service be a number of hours in which the
8 product is conditional? Should it be conditional on the
9 load levels or system conditions?

10 So we've had some discussions on this point in
11 outreach meetings and such. I haven't been surprised and
12 I'm not surprised to hear Mr. Lucas say that we should let
13 the transmission provider figure out which one of those
14 might work best and offer it in the particular circumstance
15 of the customer.

16 But I think I heard Ms. Alexander and Mr. Furman
17 make the same point, that just because hours or
18 contingencies doesn't work on a particular system, that's
19 not a reason to arbitrarily eliminate the product
20 altogether.

21 So my question is, when you two talk about
22 flexibility, is it in the nature of what Ms. McIntire
23 suggested, of let's do this in a collaborative way or let's
24 let folks get together and talk about it, or are you
25 suggesting that the tariff might let flexibility exist, such

1 that the customer and provider would work it out?

2 MR. FURMAN: When I made my comments, it was
3 -- if I wasn't articulate about it, let me try again.

4 It has to be done with standards. The tariff has
5 to have standards in it, and the devil's always in the
6 detail. But I wasn't -- I did not mean to suggest that we
7 just send people off to collaboratively look at how we put
8 this product together. I think there has to be some
9 specific guidelines and standards that say --

10 And it may be that, you know, that should be that
11 we have to operate a couple of different ways. But I do
12 think there is room for optimization between the
13 transmission provider and the transmission purchaser, to get
14 a better deal, a win-win situation, to use the cliché.

15 So I think you want to have some flexibility
16 within those standards. Now you're going to ask me what
17 standards, and I don't know.

18 (Laughter.)

19 MS. ALEXANDER: I agree. We have to have some
20 level of standards in the tariff, that will at the same time
21 provide flexibility for multiple options to consider
22 transmission service requests.

23 That's, you know, one of the other challenges
24 we're facing is how do we accomplish that, because it sounds
25 kind of contradictory. You know, the more you micromanage

1 it in the tariff, the less flexibility you give the
2 transmission providers.

3 The less you micromanage it in the tariff then,
4 you're back at the same setup, where you've got complaints
5 well, they're not being fair in what they're offering us.
6 So we have to figure out what the right balance is on that.
7 But there has to be sufficient teeth in the tariff to kind
8 of describe major principles, major classifications of the
9 types of things that need to be done and how they'll be
10 done.

11 But in any given transaction, it could be, you
12 know, two of those options may be off the table because it's
13 just not workable for that transaction.

14 MR. HEDBERG: Does that mean that you'd suggest a
15 menu approach in the tariff, that there be a menu of
16 conditions that could be identified, or would you suggest
17 that the stakeholder discussion group, if we go that way,
18 should narrow down the list of possible contingencies?

19 MS. ALEXANDER: I think that's what we should do,
20 really. You know, I hesitate to say a menu, because a menu
21 could end up not having something on the list that you want,
22 and it's going to be difficult for everybody to agree on the
23 menu.

24 So it may be at a slightly higher level than
25 that, in terms of definition. But I think it's something

1 that getting together a group of people to try and see how
2 it works when you start to write it down and what you try to
3 commit to, and see what could end up in the tariff and be
4 actually workable would be a good use of our time.

5 MR. LUCAS: One follow-up real quick, Lenny. If
6 I implied I didn't want that to be a collaborative process,
7 I didn't mean to. I meant providers and customers. I had
8 hoped that's the way it came across.

9 CHAIRMAN KELLIHER: Do we have any other staff
10 questions? Jennifer?

11 MS. AMERKHALL: I think this will be very quick.
12 I'm looking for consensus on the NOPR about conditional
13 firm, and I think I heard at least two areas of consensus.
14 Does everyone agree that the conditional firm service should
15 be charged at the long term firm point to point rate?

16 MR. LUCAS: You asked for agreement. I'll say
17 yes, I agree with you.

18 (Laughter.)

19 MS. AMERKHALL: I see a lot of nods. Okay.

20 MS. ALEXANDER: The one caveat is if you are
21 going to -- going back to our discussion about conditional
22 firm not being able to be converted to firm if capacity
23 happens to become available, then I'm not sure that it's
24 fair to charge them the firm rate but to say that unlike
25 other firm customers, they don't get the benefit of lumpy

1 upgrades or whatever happens on the system.

2 MR. TAYLOR: The other consideration would have
3 to be that for the actual occurrence of the condition, then
4 the customer is not receiving service during those hours.
5 So therefore the customer should not be treated as a firm
6 customer during the hours where they're actually interrupted
7 or not allowed to flow.

8 Because at that point, that customer actually
9 converts over to more like a non-firm customer.

10 MS. AMERKHALL: So you're saying you wouldn't be
11 willing to pay the long term firm rate to get that service?

12 MR. TAYLOR: It should be charged at the long
13 term firm rate, but for the hours where there's no service
14 provided.

15 MS. AMERKHALL: So refunds on those hours?

16 MR. TAYLOR: Credits, however you want to do it.

17 MS. AMERKHALL: Okay. So you're not willing to
18 pay the long term firm rate to get the service?

19 MR. TAYLOR: Yes, we are.

20 (Laughter.)

21 MS. AMERKHALL: My second area -- I hope there's
22 a little more consensus on this. I'm sorry, Natalie. Did
23 you want to --

24 MS. McINTIRE: I just wanted to follow up on
25 that, because it was a discussion that we had through our

1 process at Bonneville. That was the original suggestion
2 that we gave to Bonneville.

3 I think it's helpful for the discussion here to
4 know that the firm customer said wait, that's better than
5 what we get. If we get curtailed, we don't get any credit.
6 So it seems to me if that's the direction to go, you need to
7 make sure that you're going to at least give that same sort
8 of treatment to firm customers should they get curtailed.

9 MS. NICHOLAS-KINAS: One of the issues or ideas
10 that we'd like to further explore, and maybe try to get
11 systems in place for, would be to give those customers
12 essentially automated bites to any short-term firm ATC that
13 would become available, as opposed to trying to do something
14 else.

15 So that we wouldn't sell additional short term
16 from ATC unless their conditional firm reservations were
17 able to firmed up for that period of time.

18 MS. AMERKHALL: Thank you. That's it.

19 CHAIRMAN KELLIHER: Thank you. Colleagues, any
20 other questions? I think we have five minutes for the
21 audience. We said time permitting, we would entertain any
22 comments, hopefully questions from the audience. If there
23 are none, we could leave early.

24 (Laughter.)

25 CHAIRMAN KELLIHER: So this is your last chance.

1 Anyone in the audience want to make a comment?

2 (No response.)

3 CHAIRMAN KELLIHER: Okay, thank you. I just want
4 to say I want to thank all the panelists. I think the
5 quality of the presentations was very high. I want to thank
6 the staff and I also want to thank my colleagues.

7 The fact that we were all here today all day
8 long, I think, shows that we recognize the importance of
9 what we're doing. Thanks for your help.

10 (Whereupon, at 3:56 p.m., the meeting was
11 adjourned.)
