FEDERAL ENERGY REGULATORY COMMISSION
PUBLIC SCOPING MEETING FOR THE
ALASKA PIPELINE PROJECT

Kaktovik Community Center
Kaktovik, Alaska
February 8th, 2012
4:50 p.m.

1 DAVE SWEARINGEN: All right. Good
2 evening. Welcome. I want to thank you all for
3 coming here tonight. My name is Dave Swearingen
4 and I'm on the staff of the Federal Energy
5 Regulatory Commission, or FERC. At the front
6 table is John Peconom. Mike Boyle with the FERC
7 is also with us tonight. And Ellen Saint Onge at
8 the table in the back. We also have a
9 representative from Argonne National Labs who is
10 helping us with our environmental assessment.
11 That's Rob McWhorter. He's also at the table in
12 the back.

13 You'll notice that the meeting's
14 being transcribed. We have a court reporter. So
15 it's going to be put into the public record.

16 So let the record show that the
17 Kaktovik scoping meeting began at 4:50 p.m.,
18 February 8th, 2012.

19 The purpose of this meeting is to
20 give you the opportunity to provide environmental
21 comments specifically on the Alaska Pipeline
22 Project. The Alaska Pipeline Project is being
23 advanced jointly by TransCanada Alaska Company
24 and ExxonMobil Alaska, which I will sometimes
25 refer to as the project proponents or the

1 applicant.

2 TransCanada and ExxonMobil jointly
3 entered into the FERC pre-filing process on
4 May 1st, 2009, in which we began our review of
5 the facilities that we call the Alaska Pipeline
6 Project.

7 The FERC is being assisted in its
8 environmental review by our contractor, as I
9 mentioned before, Argonne National Labs as well
10 as a number of federal and state agencies working
11 with us in cooperation. Namely, the Office of
12 the Federal Coordinator, we have a
13 representative, Julie McKim is here from the OFC.
14 The U.S. Bureau of Land Management, we have Ralph
15 Eluska here from the BLM. He's the Alaska Native
16 Claims Settlement Act liaison and also is
17 assisting us as an adviser on Native issues.
18 Other cooperating agencies assisting us in
19 environmental impact statement is the U.S. Army
20 Corps of Engineers, the U.S. Fish and Wildlife
21 Service, U.S. Environmental Protection Agency,
22 U.S. Department of Transportation's Pipeline and
23 Hazardous Materials Safety Administration, U.S.
24 Geological Survey, U.S. Coast Guard, Eielson Air
25 Force Base and the Alaska State Pipeline

1 Coordinator's office.

2 The project will involve construction
3 and operation of a new pipeline system to
4 transport up to 4.5 billion cubic feet of natural
5 gas per day from Point Thomson to Prudhoe Bay
6 down to the Alaska/Yukon border. You can see
7 there's a map here that shows it very general.
8 Point Thomson, Prudhoe Bay, then down to the
9 Alaska/Yukon border. At the border the pipeline
10 will interconnect to a new pipeline in Canada to
11 deliver gas to North American markets in the
12 Lower 48.

13 Associated with the project are also
14 compressor stations, in-state delivery points and
15 various other facilities. Associated
16 infrastructure includes access roads, helipads,
17 construction camps, pipe storage areas, contract
18 yards, borrow sites and dock modification and
19 dredging at Prudhoe Bay.

20 In a little while I'll ask a
21 representative from ExxonMobil to take the floor
22 to give a more detailed project description. The
23 project proponents will also be able to answer
24 some of your questions regarding the project.
25 And they'll be available for you to ask some

1 questions in the back of the room after the
2 formal part of the meeting is over. You can see
3 materials over here, so when the formal part of
4 the meeting is over, stick around and you can ask
5 them questions as well about specifics about the
6 project.

7 But right now I'm going to talk a
8 little bit about the FERC scoping process and
9 public involvement. The main FERC docket number
10 for the Alaska Pipeline Project is PF09-11. PF
11 means that we're in the pre-filing stage of the
12 process. Once the proponents file a formal
13 application, a new docket number will be
14 assigned.

15 I know you can't really see this from
16 here -- and that's okay -- after the meeting's
17 over I'll be glad to step through this with you
18 if you want some more information. But just as a
19 point of reference, if the star represents the
20 point of the formal application, which we have
21 not reached yet, this is anticipated to be in
22 October of this year. Right now we're still
23 early in the process during scoping. We are
24 soliciting input from the public before the
25 formal application is filed so that when the

1 application is filed it will contain a lot of the
2 answers. And, you know, the companies take on
3 the issues that have already been brought up.
4 And then what we do, our staff, is we take those
5 issues as we move into the development of the
6 environmental impact statement before the project
7 is approved. I'll talk more about that in a
8 minute. As a visual, you can see we're still
9 early in the process. The formal application has
10 not yet been filed.

11 The National Environmental Policy
12 Act, or NEPA, requires that the FERC commission
13 take into consideration the environmental impacts
14 associated with new natural gas facilities.
15 Scoping is the general term that we use to
16 solicit input from the public before the
17 environmental analysis is conducted. The idea is
18 to get information from landowners, Alaska Native
19 groups, agencies, organizations and other
20 interested parties so that we can incorporate
21 issues of your concerns into our analysis. The
22 scoping period started last August when we issued
23 our notice of intent to prepare an environmental
24 impact statement, what we also call an NOI. In
25 that NOI we describe the environmental review

1 process, some already identified environmental
2 issues, and the steps that the FERC and the
3 cooperating agencies will take to prepare the
4 environmental impact statements, which I will
5 also refer to as an EIS.

6 If you received the NOI in the mail,
7 that means that you're already on our mailing
8 list. If you think that you might not be on the
9 mailing list or you have to update that, you can
10 give us that information in the back. That way
11 you can be sure to receive additional mailings
12 and things that we send out as the process
13 continues.

14 Now we've set an ending date of
15 February 27th, 2012, for this scoping period.
16 And as I mentioned it opened last August.
17 However, the end of this scoping period is not
18 the end of public involvement. There will be a
19 comment period including additional public
20 meetings once the draft EIS is issued. An
21 important step in the environmental review
22 process and the preparation of an EIS is to
23 determine which environmental resource issues are
24 most important to you. Basically that's the main
25 reason I'm here tonight. Your comments and

1 concerns, along with those of other people and
2 agencies participating in this process will be
3 used to focus our environmental analysis. Your
4 comments tonight, together with any that you may
5 have already filed or intend to file will be
6 added to the public record as comments on the
7 environmental proceeding.

8 Last month the project proponents
9 filed draft environmental resource reports which
10 contained information on which the public may
11 wish to comment. Because the project sponsors
12 are still developing their FERC application, your
13 comments will help the company address all of the
14 issues and potential effects. After we
15 receive -- the FERC receives a complete and
16 acceptable application, FERC staff will prepare
17 our independent analysis of the project's
18 potential impacts. We'll work with the
19 cooperating agencies to do that. We'll publish
20 those findings in a draft EIS which will be
21 mailed out to all the people on our mailing list,
22 and as I mentioned before, will be publicly
23 noticed for comments and additional meetings. We
24 will then continue our analysis and incorporate
25 the public comments into a final EIS which will

1 also be mailed to all interested parties.

2 Now our mailing list for this project
3 is well over 2,000 people, agencies, Native
4 groups and organizations. So because of the size
5 of the mailing list what we've decided to do is
6 when we issue the draft EIS and the final EIS
7 we're going to mail it out on CD. Now in the NOI
8 there was an opportunity to tell us if you don't
9 want a CD, you rather have a paper copy, that's
10 fine. You have to let us know. There's a check
11 box that I'd rather have a paper copy. Now if
12 you didn't check that box or you're not sure, you
13 can also tell us at the table on the back that
14 you'd rather have a paper copy. And if you don't
15 tell us, you're going to get a CD.

16 Now I need to differentiate between
17 the roles of the FERC commission and that of the
18 FERC environmental staff. The Commission is
19 responsible for making a determination on whether
20 to issue a Natural Gas Act certificate of public
21 convenience and necessity to the project
22 proponents. The EIS developed by FERC
23 environmental staff is not a decision-making
24 document. It does not make the decision on
25 whether to approve or not to approve the project.

1 In general the EIS describes the environmental
2 impacts associated with construction and
3 operation of the project, discusses variable
4 alternatives to the project, mitigation to avoid
5 or reduce environmental impacts and FERC staff's
6 conclusions and our recommendations.

7 So then the EIS is used to advise the
8 FERC commission to disclose to the public the
9 environmental impact of constructing and
10 operating the proposed project. The FERC
11 commission will consider the EIS, public comments
12 as well as those non-environmental issues such as
13 engineering, markets, rates, tariffs, finances
14 and design and cost in making an informed
15 decision on whether or not to approve the
16 project. Only after taking the environmental and
17 non-environmental factors into consideration will
18 the Commission then issue its finding on whether
19 to approve the project or not.

20 Now this particular project is
21 unique. It was addressed by Congress in the
22 Alaska Natural Gas Pipeline Act of 2004. Also
23 referred to as ANGPA. The objective of that Act
24 was to facilitate the timely development of an
25 Alaska natural gas transportation project to

1 bring Alaska natural gas to markets in both
2 Alaska and the Lower 48 states. That legislation
3 designates the FERC as the lead federal agency
4 for the purposes of complying with NEPA, but also
5 specifies that all federal agencies that have a
6 permitting role in the project to use the single
7 EIS to meet their required environmental reviews.

8 Are there any questions about the
9 scoping process or the way the FERC handles
10 things?

11 THE WITNESS: Was that state legislation
12 or federal legislation?

13 DAVE SWEARINGEN: ANGPA was federal
14 legislation. There was also state legislation
15 which would've been Alaska Gas Inducement Act
16 which was the one that set up the funding
17 mechanism for the project.

18 Any other questions about the FERC
19 process scoping?

20 Okay. What I'm going to do now is
21 I'm going to turn the meeting over to Myron Fedak
22 of ExxonMobil. And he's going to provide a
23 project overview. And then we'll turn it back --
24 I'll take the meeting back and we'll have an
25 opportunity for public comments.

1 Myron?

2 MYRON FEDAK: Does everybody have the
3 series of handouts?

4 Good afternoon. My name is Myron
5 Fedak. I am the Alaska Pipeline Project
6 environment regulatory land manager and I head up
7 our office.

8 What FERC asked us to do as an
9 applicant is to very quickly give you a high
10 level overview of what APP is all about.

11 On slide 2 is -- most of these points
12 were already stated by FERC staff. APP is a
13 joint undertaking by TransCanada and ExxonMobil.
14 The project's being set up to move natural gas
15 from the North Slope to markets in the Lower 48.

16 FERC is our lead agency under the
17 U.S. Natural Gas Act. They will be the ones
18 preparing the environmental impact statement. As
19 this was mentioned, we're also under state
20 legislation for the rest of this project under
21 the Alaska Gasline Inducement Act.

22 We have filed in January, 11 resource
23 reports, several thousands pages. And so I'm
24 just going to talk a little bit about the
25 project. We also have here what our current

1 planning basis is for pipeline routing. So after
2 the meeting we'll be pleased to talk with you
3 about where we've situated pipelines in the
4 facilities.

5 Slide 3 attempts in one page to give
6 you a snapshot of the entire project. It's an
7 overview of the three key project components.
8 Begins not far from here with Point Thomson gas
9 transmission line, about 58 miles which will take
10 raw gas from Point Thomson Unit to a new gas
11 treatment plant that we would build. The gas
12 treatment plant will be located within the
13 Prudhoe Bay Unit and simply it will take raw gas
14 from Point Thomson and Prudhoe Bay, treat it to
15 pipeline quality, compress it and send it down
16 along the pipeline.

17 The Alaska mainline is approximately
18 1,700 miles, connect to existing major
19 distribution pipelines in Alberta, Canada. Of
20 that, 745 miles is in our state. We have eight
21 compressor station in our state of Alaska. And
22 I'll talk about those also.

23 We have in accordance with our
24 requirements under AGIA committed to provide at
25 least five in-state natural gas delivery points.

1 Those will not be our choices. Those will be the
2 points that we are instructed to install. And if
3 they are not told to us before construction they
4 can be installed later.

5 Just to give you a high level
6 perspective on how much land you physically walk
7 on and touch, during construction we touch about
8 32,000 acres in the state of Alaska. Notice it's
9 almost three times what we would have during
10 operations. During construction we have
11 temporary space, much wider corridor to build and
12 install the pipeline, storage yards, construction
13 camps, temporary access roads and so forth. Once
14 the construction is done, the facilities are
15 operating, we'll work to restore temporarily
16 disturbed land.

17 So let me step through the three
18 project components beginning on slide 4. You'll
19 see the Point Thomson gas pipeline beginning in
20 the east and west Prudhoe Bay. The detailed maps
21 here in a much greater level of detail you can
22 look at after the meeting. Pipeline is
23 approximately 32 inches. It will handle
24 one billion standard cubic feet a day of gas,
25 1,100 pounds of pressure. The minimal wall

1 thickness will be over a third of an inch of
2 steel. And because we're burying the pipeline in
3 this arctic zone the gas will be chilled to below
4 freezing before entering the pipeline.

5 So it's transmitted to a new gas
6 treatment plant which is on slide 5. As I stated
7 it's in Prudhoe Bay Unit. And if you look at the
8 map on the left-hand side, colors indicate
9 different things. Yellow are existing
10 facilities. So you see things like the central
11 gas facility and the central compress plant,
12 certain injection wells, West Dock. Those are
13 all existing Prudhoe Bay facilities. In orange
14 are facilities that APP would install. You have
15 the gas treatment plant in the bottom left-hand
16 corner. New roads that we'd have to build to
17 provide access. And in red are existing
18 facilities that we would modify. Mostly roads to
19 West Dock.

20 Pure and simple the gas treatment
21 plant takes up to 5.3 billion standard cubic feet
22 a day of natural gas in its raw impure state,
23 treats it about to 4.5 billion standard cubic
24 feet a day and brings it up to 2,500 pounds of
25 pressure. Simply put, it'll remove the

1 impurities, it'll pull out the water, it'll
2 compress the 2,500. Again, because of arctic
3 conditions we'll chill the gas, put it into a
4 buried pipeline. There is a significant amount
5 of CO2, we will pull the CO2 out. It will not go
6 to the vent -- it will not be vented to the
7 atmosphere. It will be sent back to the
8 producers for reinjection.

9 To do all this will take about a
10 million horsepower. Virtually everything powered
11 by the natural gas that's treated and used.

12 The modules that comprise the bulk of
13 the gas treatment plant will have to come in on
14 West Dock, Dock Head 2. Because of the size of
15 the modules, bigger than anything that we've ever
16 brought up to the Slope, there will be a bit of
17 dredging and we'll need to modify the dock
18 itself.

19 To give you kind of a visual
20 perspective, on slide 6 you have a picture of
21 existing facilities at Prudhoe Bay on the left.
22 The central compressor plants in the foreground,
23 central gas facility in the background. And on
24 the right-hand side is a computer artist's
25 generated sketch of what our gas treatment plant

1 design looks like today. When it's built out the
2 facilities will look very similar from a distance
3 to the existing facilities you see on the left.

4 So the gas treatment plant will put
5 the gas into the Alaska mainline, which is on
6 page 7. This pipeline, which traverses 745 miles
7 in our state, is 48 inches in diameter,
8 predominantly buried. There will be a few spots
9 where it comes out of the ground. There are a
10 small number of faults that we know, so the
11 pipeline will be aboveground and cross those
12 seismic faults. Still looking at options, it'll
13 probably span one or two rivers with aerial
14 pipeline crossing. Next, the natural gas will be
15 cooled. And if you look at the route, it's
16 basically parallel to existing highways and TAPS
17 down towards Delta Junction and continues along
18 the highway to the Yukon.

19 You'll notice given the high
20 pressure, 2,500, the smallest pipeline steel
21 thickness is almost an inch. It'll be in a range
22 of an inch and a quarter in spots where needed.

23 We talk about the pipeline, we talk
24 about a pipeline system. Includes a number of
25 other facilities, like, meter stations. We'll

1 have major block valves about 20 miles apart.
2 Pig launchers and receivers to help clean the
3 inside of the pipeline and compressor stations
4 about 90 miles apart. And, again, the provisions
5 of a minimum of five offtakes within Alaska at
6 places APP is told to install them.

7 Slide 8 is compressor stations. As
8 the gas flows down the pipeline it gets warmer
9 and it loses pressure. So the compressor
10 stations do two simple functions. They
11 recompress the gas back up to 2,500 and they cool
12 the gas back down. The eight stations are set
13 about 90 miles apart, roughly 25 acres per site.
14 45,000 horsepower of gas turbine compression at
15 each compressor station.

16 So we have a total of eight. Six
17 will have one large turbine. The picture on the
18 bottom right is an actual installation on
19 TransCanada that is operating in northern
20 Alberta. You see one big building in the middle.
21 That's the one big compressor turbine. Up at the
22 top is a computer-generated sketch of our current
23 design. Again, you'll see one big building in
24 the center with a generator where the turbine is.
25 What you don't see down below that you see up at

1 the top are gas aerial coolers which will be used
2 to chill the gas back down. Natural gas will be
3 used as fuel.

4 The entire pipeline system is being
5 designed for remote operation. We'll have a few
6 limited living quarters on site to help us
7 through certain periods.

8 Slide 9 is a project schedule that's
9 been our guiding light since 2008. We have been
10 meeting every deadline on it. And our next major
11 deadline is submittal of the application formally
12 to FERC in October of this year. Under the
13 proposed time line, under the assumption that
14 FERC provides approval in 2014, the project will
15 move forward in construction. We'll need to get
16 appropriate regulatory approval beyond just FERC,
17 commercial support from natural gas shippers, and
18 project sponsors themselves will have to agree to
19 spend tens of billions of dollars to make this
20 project a reality.

21 So on page 10, again, I want to thank
22 you for your attendance today. FERC staff has
23 made you aware of various meetings to provide
24 your comments, today through this meeting or
25 written form or electronic form. And, again,

1 we've provide a Web site that has more
2 information about the Alaska Pipeline Project.

3 Thank you.

4 DAVE SWEARINGEN: Thank you, Myron. Are
5 there any questions specific to the project
6 design that you might have right now?

7 GEORGE TAGAROOK: Looking at the map where
8 they have Point Thomson to Prudhoe Bay, every
9 year Exxon or oil companies make ice road and
10 spend millions of dollars building ice roads,
11 they could build permanent roads from Prudhoe Bay
12 to Point Thomson that will get us half way to
13 Kaktovik, you know? If they open that way or go
14 over the top on the pipeline it will benefit the
15 industry. It'll benefit local economy. Because
16 we start to connect to the pipeline, you know,
17 we'll have trucks coming from Deadhorse or
18 whatnot, you know, that's economics, you know?
19 And oil companies are melting millions of dollars
20 every year. You know, how many years Prudhoe
21 Bay's been in existence? And how long has Exxon
22 been in existence? You know, they make ice roads
23 out on the ocean, there's ice roads on the tundra
24 and it doesn't come back. Just spent money and
25 the money melts on the ground. They have

1 permanent roads, you know? Every year, you know,
2 build the road, it's gone. If they make ice
3 roads, you know, I would prefer that real short
4 50 or 60 miles. And that'll benefit, you know,
5 future generations from Kaktovik. They start to
6 open that way we'll connect to that Point Thomson
7 road. It costs \$800 just to fly in and out of
8 Kaktovik round trip. \$780 round trip, right? We
9 could drive for less than couple hundred dollars,
10 you know? That's not including paid for
11 insurance, lodging, you know, and all that other
12 stuff.

13 DAVE SWEARINGEN: I appreciate -- I
14 appreciate the comment. We're actually going to
15 move into the part of the meeting where we
16 receive comments like that. Before we move on I
17 just want to know, is there any questions about
18 the design of the project that --

19 GEORGE TAGAROOK: Part of your road is the
20 design.

21 DAVE SWEARINGEN: I know. I know. I'm
22 talking about what was just explained.

23 GEORGE TAGAROOK: Throwing money away.

24 DAVE SWEARINGEN: Okay. We'll get to that
25 in just a second.

1 LISA GRAY: Well, I think he's asking the
2 question, Is that road being designed as an ice
3 road right now or gravel road right now?

4 MYRON FEDAK: The current design is for
5 construction of that pipeline one winter season
6 with one ice road. Because once the pipeline's
7 installed we will not need permanent access to
8 the pipeline or the facility.

9 GEORGE TAGAROOK: Point Thomson came up
10 about a month ago to give us all these
11 alternates, you know, alternate A, B, C, D. Ice
12 road through the ocean, ice road through the
13 tundra, pipeline. And then alternative D had
14 roads from Point Thomson all the way to Prudhoe
15 Bay. Quit melting, you know, money on ice roads,
16 you know, we could build gravel roads.

17 Thank you.

18 DAVE SWEARINGEN: Okay.

19 BEN HUNDSAKER: As far as with the
20 pipeline being built, if you need to perform
21 maintenance somewhere along the line where
22 there's no road access, gravel road access, how
23 do you intend on taking care of that?

24 MYRON FEDAK: During operations we will
25 have overflights and visuals. If there's a need

1 to get on the ground, one is it's a rare
2 occurrence needing to put people on the ground.
3 If that occurs and it's in the winter we've got
4 vehicles that can travel. Because we're talking
5 if there's a problem that needs a repair, we're
6 not talking bring phenomenal amounts of equipment
7 out. During the summer program and, again,
8 different kinds of vehicles that minimize the
9 impact on the environment. And depending what it
10 is, some of that can always be flown in with
11 helicopters and the large part of the equipment
12 and personnel dropped exactly into the location
13 they need to be.

14 BRUCE INGLANGASAK: If it's underground
15 and you have a small leak underground how are you
16 going to detect it before it's too late?

17 MYRON FEDAK: Well, other than the
18 probability of those leaks being rather small,
19 there are leak detection systems. This is not
20 oil. And because it's a gas, if it's a small
21 leak, pressures will drop from 2,500. They
22 become very noticeable much more quickly.

23 DAVE SWEARINGEN: For the sake of the
24 court reporter what we're going to do is we're
25 going to move on. Because, like, right now it's

1 difficult to get the comments from the back.
2 We're going to move on to the part of the meeting
3 where I invite people to come up and present
4 their comments to us. That'll be more helpful.
5 That way the court reporter can get it all into
6 the record. If you have a very specific
7 questions, after the meeting we'll stick around
8 and be glad to answer them for you. So if you
9 have a question or a comment, if you could come
10 up and actually give your name and actually
11 present the comment, that would be helpful for
12 the entire meeting.

13 So I don't think we had anyone
14 actually signed up to speak; is that correct?
15 Right. We don't have anybody that signed up to
16 speak. So we can just move on into the point
17 where anybody that wants to have a comment can
18 come. We'll just take turns. So if you want to
19 come up, that would be great. You can come up
20 and you can provide the comments or whatever that
21 you want to say about the project.

22 You want to go first?

23 GEORGE TAGAROOK: Yeah, I'll go first. I
24 don't know why we need to go through Canada, you
25 know, the pipeline. Canada's got enough natural

1 gas in the world they're getting from McKenzie.
2 We just do all of these state gas lines. Get
3 McKenzie gas from Canada and take it up to
4 Prudhoe Bay. I mean, that's my comment for now.

5 DAVE SWEARINGEN: Okay. Thank you.

6 GEORGE TAGAROOK: I got till October,
7 right?

8 DAVE SWEARINGEN: Yes, you do.

9 GEORGE TAGAROOK: Come in 49 miles. How
10 many miles is that Canadian gas line? 3,400-some
11 miles all the way to Chicago or -- how many miles
12 is that? Who's going to benefit? Canada.

13 DAVE SWEARINGEN: Well, actually none of
14 the gas is going to be distributed into Canada.
15 The gas will be distributed into Alaska and into
16 the Lower 48. Canada does not get the
17 distribution of the gas. So Canada --

18 GEORGE TAGAROOK: Well, they're going to
19 change their mind and say, we're going to tap
20 into it.

21 DAVE SWEARINGEN: As the legislation is
22 now, the gas is specifically designed for Alaska
23 and the Lower 48, not Canada. Sir, did you
24 have -- did you want to come up and provide
25 comments? Yes, sir, you can come up.

1 GEORGE KALEAK: You said Canada's not
2 going to benefit from it.

3 DAVE SWEARINGEN: I said they weren't
4 going to receive takeoffs of the gas. That's
5 correct.

6 GEORGE KALEAK: They are going to benefit
7 from it. They're not going to do it for free. I
8 mean, there's some benefit that goes into
9 building this gas pipeline through Canada.

10 DAVE SWEARINGEN: I'm sure there, sir.

11 GEORGE KALEAK: And when you say they're
12 not going to benefit, this is totally, totally
13 wrong.

14 DAVE SWEARINGEN: No, I did not say they
15 weren't going to benefit. I said they were not
16 going to receive offtake of the gas. They will
17 probably benefit.

18 Yes, Myron?

19 MYRON FEDAK: Now similar to Alaska there
20 is a commitment to provide offtakes to local
21 distributions --

22 GEORGE KALEAK: See.

23 MYRON FEDAK: -- in Canada, but it's not
24 for major use.

25 DAVE SWEARINGEN: Okay.

1 GEORGE KALEAK: And my other question is
2 the detection of the -- especially on the green,
3 from Point Thomson to Prudhoe Bay where a lot of
4 our campers or subsistence hunters go through and
5 they hunt there, and they do not like no
6 aircraft. That's why we avert a lot of the other
7 companies that want to do any kind of projects
8 around our area, our subsistence area and make
9 them fly 15 feet -- 1,500 feet and above and not
10 go low. And if you're going to try to detect
11 these leaks or -- or look at the pipeline, you're
12 going to have to fly low. And a lot of our
13 subsistence hunters, me being one of them don't
14 like no low-flying aircraft. And we'll take your
15 number and report you. And that's a big problem.

16 DAVE SWEARINGEN: I appreciate that
17 comment. Can we get your name for the record?

18 GEORGE KALEAK: I did.

19 DAVE SWEARINGEN: Oh, you said it. Okay.
20 Good.

21 Okay. Anyone else?

22 BRUCE INGLANGASAK: The pipeline is
23 underground, and if erosion starts, the
24 permafrost starts melting, are those pipes going
25 to handle that pressure? Because I know in

1 Canada they got this problem with short little
2 gas pipelines, shorter than what you're planning
3 for right now. It's permafrost erosion over
4 there, and from what I heard they're having
5 problems. What do you think about this?

6 DAVE SWEARINGEN: Okay. Permafrost and
7 erosion. We'll consider that. Thank you, very
8 much.

9 BEN HUNDSAKER: One of my questions -- my
10 question was, Would there be any possibility for
11 pipeline coming this direction so the community
12 can benefit from the natural gas? And obviously
13 you got to have a station to purify and all those
14 kind of resources.

15 DAVE SWEARINGEN: Yeah, that's an economic
16 negotiation between the company and the
17 community. So an environmental impact statement
18 isn't going to dictate -- the FERC is not going
19 to dictate where the gas gets delivered to. I do
20 know that there's already been four communities I
21 believe that have tentatively been agreed upon to
22 have takeoff points. And that was Fairbanks,
23 Tok --

24 MYRON FEDAK: Livengood and Delta
25 Junction.

1 DAVE SWEARINGEN: Delta Junction and
2 Livengood.

3 MYRON FEDAK: They've not been agreed to.
4 We sponsored an independent study that was
5 overseen by the state that went through the
6 economic analysis and said from what their
7 analysis showed, those are the four likely
8 locations. There's no agreement on any location
9 at all. And, again, this is -- we are a pipeline
10 company. What we do -- end up is signing a
11 contract with the producers who own the gas.
12 They're the ones that will need to make contracts
13 with local distribution systems, with
14 communities, what have you. It's their gas. All
15 we're doing is stating we'll take your gas and
16 move it from point A, point B or C.

17 If the producers have a contract and
18 they decide they want to move some of their gas
19 to a community, then they'll come to us and say
20 we want you to do this. But it's not our -- it's
21 not our gas.

22 BRUCE INGLANGASAK: Another question, are
23 we going to pay a higher price than Fairbanks if
24 we do get this stuff?

25 DAVE SWEARINGEN: I personally can't

1 answer that. That's outside of the environmental
2 impact statement, the prices of gas. That's not
3 what I'm here to help you with. So I apologize,
4 I cannot answer that question.

5 KEN SIMS: Ken Sims. I hear recently
6 there's been an explosion in gas in the Lower 48
7 with some sort of shale gas or something of that
8 nature, and frankly making all this sort of
9 obsolete because they got enough gas to handle
10 their needs for apparently a long time to come.
11 So, you know, my opinion, that being the case, in
12 the north the environment here is very delicate,
13 you know? A lot of little things, building that
14 road, it's going to affect the area, you know?
15 And all the little things they -- maybe not just
16 that one by itself but all the other things
17 they're doing. Nuiqsut, Alpine, the petroleum
18 reserve they're opening up over there, it's my
19 opinion, it's a lot more than what this
20 environment can handle. We're already getting a
21 lot of air -- air quality from Prudhoe Bay, you
22 know? We can see it sometimes. And what's this
23 new gas plant they got going up there, with how
24 many compressors in that plant you got? How much
25 air quality's that going to disturb up here, you

1 know. It don't clear up like it does down south
2 where you can have -- where it dissipates
3 quicker. In the cold things are slow and it
4 takes time. And the same thing that they can do
5 wantonly and without regard down there we can do
6 it up here without the same kind -- you know,
7 it'll have more of a drastic effect. I just
8 don't think it's smart, you know, it shouldn't be
9 done. Too much of an environmental cost to us
10 which is not really needed. So too bad for
11 ExxonMobil, you know? I mean, I know they want
12 to make money, but, hey, it's not all about
13 money.

14 That's my comment. Thank you.

15 DAVE SWEARINGEN: Thank you Mr. Sims.
16 Anyone else?

17 EDWARD REXFORD: Edward Rexford. The
18 concern I have is there was talk recently that
19 they will be doing fracking. And I know that's a
20 controversial subject down in the Lower 48. And
21 with the permafrost being frozen and they do that
22 here for this project, I'm pretty sure the
23 environmental damage -- you know, because it's
24 going to migrate through the cracks. And that's
25 going to be a touchy subject, I know, but that's

1 got to be addressed and looked into very
2 carefully I think because this is setting a
3 precedent in the Arctic to frack. And that's got
4 negative impacts.

5 Thank you.

6 DAVE SWEARINGEN: Okay. I can't speak to
7 the withdrawal, but I know that the natural
8 construction of the pipeline that's being
9 presented here, that construction does not
10 involve fracking for the construction operation
11 of the pipeline.

12 EDWARD REXFORD: So it'll probably be done
13 by the oil company.

14 DAVE SWEARINGEN: Their extractions
15 methods -- I'm not familiar with the engineering
16 of their extraction methods. This pipeline --
17 the take away will not involve fracking.

18 CLARICE AKOOTCHOOK: So when I see the
19 green up there that means they found something
20 over there. So I'm hoping that everything will
21 go up and the oil people will help with the
22 village again because we're losing some stuff
23 here in our village due to lack of money.

24 BRUCE INGLANGASAK: Dehydrate and
25 compress, is that something like fracking?

1 MYRON FEDAK: Dehydrate means take the
2 water out. And then compress is the gas will be
3 depending where in the plant --

4 BRUCE INGLANGASAK: Reinjection.

5 MYRON FEDAK: Reinjection means that we
6 will send CO2 back to the producers. They will
7 send it back underground.

8 BRUCE INGLANGASAK: Okay. So how much
9 pressure are you applying when you putting it
10 back into the ground?

11 MYRON FEDAK: That will be up to the
12 producers. Right now they're doing that by -- as
13 they're producing oil and gas, because there's no
14 way to move the gas out, they're reinjecting the
15 gas right now by putting some of that gas back
16 into the reservoirs actually increasing the
17 amount of oil production.

18 BRUCE INGLANGASAK: So the pressure will
19 have to change to force the oil out?

20 MYRON FEDAK: Force the oil back up a
21 little bit. But those decisions as to where the
22 gas goes, and what pressure it goes, and how many
23 wells they use, that's all going to be the
24 producers.

25 BRUCE INGLANGASAK: So this is natural

1 gas?

2 GEORGE KALEAK: It's coming out of the
3 ground anyway and it's being burned. Why waste
4 all of that natural gas when you -- when it could
5 be used again, so to speak, to be boost up the
6 millions -- the hundreds of thousands of barrels
7 per day. Just to make you understand, they
8 reinject it back in.

9 MYRON FEDAK: What you're doing is as you
10 produce oil and gas the pressure in the reservoir
11 goes down. By recycling some of that gas back
12 into the reservoir the pressure goes down more
13 slowly.

14 CLARICE AKOOTCHOOK: This is Clarice
15 again. I heard rumors they found more gas in
16 Point Thomson than they did at Prudhoe Bay. How
17 come we don't know what they're finding over at
18 Point Thomson?

19 DAVE SWEARINGEN: I Don't know what
20 they're finding in Point Thomson either, ma'am.

21 CLARICE AKOOTCHOOK: They've found
22 something.

23 DAVE SWEARINGEN: I don't know what rumors
24 that you've heard.

25 Any more environmental comments,

1 environmental concerns about the proposed
2 projects?

3 GEORGE KALEAK: Get it done.

4 DAVE SWEARINGEN: Okay. I think that
5 we've heard that there's some interesting
6 questions, you know, questions about some of the
7 procedures and things. We'll hang around
8 afterwards, the company personnel and I will. I
9 don't know how many of those we'll be able to
10 answer, but we'll be glad to, you know, do the
11 best that we can with that.

12 GEORGE KALEAK: I got another very
13 important question. What percentage or -- what I
14 want to know is what percentage of Alaska is
15 hired and what percentage is from the Lower 48
16 and what percentage is actually from Canada that
17 are all -- I know this is going to get contracted
18 out some way or another in this project.

19 DAVE SWEARINGEN: Okay. I have two
20 answers to that. The first one is I know that
21 the project proponents have a plan in place to
22 involve local hire. I'm going to let one of the
23 others explain what that plan is.

24 MYRON FEDAK: I think in some of our other
25 meetings, Lisa was here, we're gathering

1 information on people's desires to work,
2 companies who are available to work and so forth.
3 We are many years away from getting into any
4 detailed discussions. It is in our mutual best
5 interest to hire locally. That is better for the
6 community and usually it's better for the project
7 because we manage the cost involved to bringing
8 other people in.

9 GEORGE KALEAK: Is it for the whole
10 duration of the whole project? Is all Alaskans
11 or the majority of them are Alaskans?

12 MYRON FEDAK: Well, I can tell you that
13 there aren't enough Alaskans available to build
14 this project.

15 GEORGE KALEAK: What do you mean there
16 aren't enough?

17 MYRON FEDAK: Between -- and I can't -- we
18 have reports of --

19 GEORGE KALEAK: How many people is it
20 actually going to take to do this project?
21 There's not enough Alaskans?

22 LISA GRAY: Well they have to be a
23 particular type of workers. We need a welder
24 that can weld. The pipeline's an inch thick. So
25 it's a particular type of workforce that we're

1 trying to develop. Jerry is here with the State
2 of Alaska, Department of Labor Workforce
3 development. So after the meeting if you want to
4 talk with him. The State of Alaska is very
5 interested in developing a workforce.

6 GEORGE KALEAK: I'm not trying to look for
7 work. I'm retired.

8 LISA GRAY: But if you have kids in the
9 community and -- we're trying to develop a
10 workforce. So we've got people here who are
11 happy to talk to you about that kind of -- it's a
12 great question and we're very much interested in
13 continuing the conversation. I'm not trying to
14 take over the meeting, it's just they have a
15 certain part they need to do and then we're happy
16 to talk about that. And Jerry's here too.

17 DAVE SWEARINGEN: Yeah, I was -- I
18 attended the open houses that APP put on last
19 year. And a big focus of that presentation the
20 company gave was their efforts to be sure the
21 people had the correct training and such, they
22 were prepared to be hired when that time would
23 come. So I know there is a program in place and
24 it is being developed. So I do know that. And
25 to the extent that the environmental impact

1 statement will consider socioeconomic impacts and
2 the impacts of jobs and cash revenue, things like
3 that. So that will be in our analysis as well.

4 Does anybody else have any
5 environmental comments?

6 CLARICE AKOOTCHOOK: Some years back they
7 had a well over here. There's no information to
8 give to us about what went down over there?

9 GEORGE KALEAK: No, that was Chevron.

10 I have one environmental one, I
11 think. You know, with all the politics and ANWR
12 and the Sierra clubs, you know, that go along
13 with it, is there any of the environmentalists,
14 so to speak, you know, going to you guys and
15 trying to stop this project?

16 DAVE SWEARINGEN: Well,
17 environmentalists -- being a public scoping
18 period, environmentalists have every right to
19 give their comments just like anybody else does.
20 We have received some comments in meetings and
21 people speaking in meetings concerned about
22 environmental impacts. But to say that
23 environmentalists or something can stop a
24 project, that's -- all they can do is provide the
25 same type of input and concerns, and we will take

1 under consideration. So that's all I can tell
2 you about that.

3 UNIDENTIFIED SPEAKER: How come you guys
4 don't build aboveground instead of below?

5 DAVE SWEARINGEN: You know, standard
6 operating and design for natural gas pipelines is
7 for them to be buried. It's safer that way, and
8 that's just -- that's the way that the natural
9 gas pipelines are designed to be buried.

10 UNIDENTIFIED SPEAKER: And on your --
11 between borders are you going to have -- is the
12 prices for the gas going to be fluctuating?

13 DAVE SWEARINGEN: I can't -- I can't
14 answer any pricing questions. That's outside of
15 the scope of what we're doing here.

16 Okay. I'm actually going to close
17 the formal part of the meeting. I'm not leaving
18 quite yet, the folks aren't leaving, but we're
19 going to close the formal part of the meeting.

20 Anyone wishing to purchase a copy of
21 the transcript can make those arrangements with
22 the court reporter.

23 Within the FERC Web site,
24 www.FERC.gov, there's a link called eLibrary. If
25 you type in the docket number, which is PF09-11

1 -- and this information's also on the handout at
2 the back table -- you can use eLibrary to gain
3 access to everything that's on the public record
4 concerning the project, including information
5 that's submitted to the FERC and also issuances
6 by the FERC commission -- I mean, by the FERC
7 staff.

8 So on behalf of the Federal Energy
9 Regulatory Commission I want to thank you all for
10 coming here tonight. Let the record show that
11 the Kaktovik meeting concluded at 5:45 p.m.

12 Thank you.

13 (Scoping meeting concluded at 5:45 p.m.)
