
APPENDIX R

Comments on the Draft EIS and Responses

Jordan Cove Energy Project

Comments on the Draft EIS and Responses

INTRODUCTION

Between the issuance of the Notice of Availability (NOA) for the draft Environmental Impact Statement (draft EIS) on March 29, 2019, and the close of the comment period on July 5, 2019, the Federal Energy Regulatory Commission (FERC) received approximately 1,449 individual written letters commenting on the draft EIS, including 3 letters from federal agencies, 3 letters from state agencies (including one combined letter from various Oregon state agencies); 27 letters from federal and state senators and congressmen; 12 letters from a local government agencies and officials; 7 letters from Indian tribes; 106 letters from companies and organizations (including multiple submittals that combined letters from different organizations/individuals under one accession number); and 1,291 letters from individuals (which also included submittals that combined letters from different individuals under one accession number). We also received some comment letters filed after the close of the official comment period, which we have we considered and included in the analysis to the extent possible¹.

The BLM and Forest Service also reviewed the comments that were submitted on the draft EIS that were specific to their proposed actions or authorities. The BLM and Forest Service provided FERC with their responses to the comments specific to the BLM and Forest Service actions or authorities, which are included in this appendix.

This appendix presents our responses to relevant comments provided on the draft EIS. Comment letters are classified as follows:

- FA: Federal Agencies
- EO: Elected Officials
- SA: State Agencies
- LA: Local agencies (e.g., counties) and Officials
- TR: Tribal Governments
- CO: Companies and Organizations
- IND: Individuals
- PM: Public Meeting Transcripts

Table R-1 includes an index of comments on the draft EIS, including the agency/organization/name of the commenter, date the comments were filed, FERC accession number, and the comment code. Table R-2 provides our responses to the majority of comments that were filed; however, some comments were addressed via a “side-by-side” approach due to the complexity or scope of the comments. These additional comments are addressed individually at the end of this appendix via the “side-by-side” approach. Most of the comment letters addressed via the side-by-side approach also contained attachments and appendices that were not direct comments on the draft EIS or the Project. These attachments have not been included in this final EIS appendix, but can be found on the FERC eLibrary filed under the applicable accession numbers.

¹ Note that our response to comment includes some comments filed after the end of the official comment period.

TABLE R-1 a/

Index of Commenters on the Draft Environmental Impact Statement

Agency/Commenter Name	Date of Letter/Comment Session	FERC Docket Accession Number	Comments
Federal Agencies (FA) and Elected Officials (EO)			
Congressman Scott Tipton	4/18/2019	20190424-0021	Cultural 2; General 5; Socioeconomics 12
EPA Region 10	6/28/2019	20190708-5022	see side-by-side response
Governor of Wyoming, Mark Gordon	7/5/2019	20190703-5205	General 8
Oregon State Senator Arnie Roblan	4/18/2019	20190424-0014	General 5
Oregon State Senator Dallas Heard	4/18/2019	20190424-0018	Cultural 2; General 5

Note:

a/ "N/A" is used to denote filings that contained comments considered to be out-of-scope. Examples of out-of-scope issues include comments regarding the public benefit or need to export LNG (by a Canadian company); comments on the State's permitting process; history of the Project (i.e., the multiple past applications; horizontal hydraulic drilling through shale formations during exploration for natural gas (often referred to as "fracking"); induced production of natural gas; number and percentage of easement agreements; downstream greenhouse gas emissions resulting from the combustion of exported gas; the concept of a "programmatically" EIS to cover LNG export terminals throughout the United States; the structure and format of FERC public meetings; the availability of hard copies of the draft EIS; the differences between "FERC Recommendations" versus "FERC Conditions"; and administrative information technology system operations at the FERC. These issues are not addressed in this EIS. As appropriate, some of these issues may be addressed in any Order the Commission may issue.

TABLE R-2		
Comments on the Draft Environmental Impact Statement and Responses		
Comment Code	Comment Summary	Response
General		
General 1	General opposition to the Jordan Cove Energy Project (Project) was expressed, citing various perceived adverse impacts on the human and natural environments (e.g., concern for environmental resources, public safety, risk of terrorism, and nearby communities). These general comments did not specifically acknowledge the draft Environmental Impact Statement (draft EIS) nor did they cite specific concerns with information presented in the draft EIS. Additionally, they did not request additional or modified information be included in the final Environmental Impact Statement (final EIS). A common concern cited regarding public safety included comments on potential earthquake, tsunami, and/or fire.	The purpose of an EIS is to disclose environmental and social impacts, and the potential impacts identified in the general comments are addressed, by topic, in the draft EIS. The EIS's Table of Contents identifies the environmental and social topics evaluated, including evaluation of public safety risk, and where that analysis can be found in the EIS. Opposition to the Project has been noted.
General 2	The draft EIS analysis inadequately addressed environmental impacts, public concerns, the National Environmental Policy Act (NEPA), or the Federal Administrative Procedures Act (FAPA). The draft EIS concluded that "constructing and operating the Project would result in temporary, long-term, and permanent impacts on the environment"; and that "many of these impacts would not be significant or would be reduced to less than significant levels with the implementation of proposed and/or recommended impact avoidance, minimization, and mitigation measures." These conclusions were not supported in the EIS and a supplemental draft EIS should be provided for public comment prior to the final EIS or Order. The EIS must thoroughly present the baseline environmental conditions.	Although numerous commenters expressed general dissatisfaction with the analysis and conclusions of the draft EIS and alleged they were incorrect or unsupported, with some commenters citing specific conclusion statements from the draft EIS, most of these comments did not specifically identify how they were incorrect or unsupported. Without specificity, we cannot address these comments. Where commenters provide specific comments related to a specific conclusion, we have provided a response as appropriate. A supplemental EIS is not required and will not be developed.
General 3	Eminent domain should not be used for the Project.	Section 7(h) of the Natural Gas Act (NGA) grants Certificate holders the authority to use eminent domain to acquire the necessary access and easements for a pipeline. If we issue Pacific Connector Gas Pipeline LP (Pacific Connector) a Certificate, it will convey eminent domain authority for the Pacific Connector Gas Pipeline Project. However, authorizations under Section 3 of the NGA do not convey eminent domain authority. Thus, if we grant Jordan Cove Energy Project LP authorization under Section 3 of the NGA, it will not convey eminent domain authority for the Project's LNG terminal facilities.
General 4	The EIS should address the environmental effects that would result from an inadvertent leak or rupture of the pipeline or LNG terminal. The EIS should look at the effects on water quality, aquatic resources, air quality, climate change, and public safety concerns. The EIS should also address the potential for leaks from an LNG carrier vessel and possible mitigation.	Potential impacts on public safety in the event of an inadvertent leak or rupture at the LNG terminal or along the pipeline are addressed in section 4.13 of the EIS. The EIS does not assess potential environmental impacts from a potential leak or rupture because the likelihood is extremely remote, and the location and extent of environmental impact would be speculative. However, natural gas is lighter than air and, in the unlikely event of a leak along the pipeline, natural gas would likely not contaminate soil or rivers, because it generally does not dissolve in water and it would escape upward and be dispersed in the atmosphere. LNG carrier integrity, including vessel design and the history of on-sea incidents and leaks, is addressed in section 4.13.1.1 of the EIS.
General 5	Comments on the length of the official public comment period were received. Comments requested that the official comment period on the draft EIS be extended beyond 90 days. These comments expressed that 90 days was not enough time to fully digest the vast amount of information provided. Other comments requested that the official comment period on the draft EIS not be extended beyond 90 days.	The comment period for the Project is consistent with the NEPA, which established a minimum of a 45-day period for public review and comment. The comment period was extended to 90 days due to federal requirements related to the U.S. Department of Agriculture Forest Service (Forest Service) and Bureau of Land Management (BLM) Plan Amendment appeal process. We believe that 90 days is sufficient to review and provide comment on the draft EIS, and no additional extensions have been granted; however, as a matter of standard practice, we fully considered all comments received after the close of the comment period to the extent possible.
General 6	FERC should hold public comment meetings in Klamath, Jackson, Douglas, and Coos counties.	We held public comment meetings during the week of June 24, 2019 in the following locations: Coos Bay on June 24, Myrtle Creek on June 25, Medford on June 26, and Klamath Falls on June 27.
General 7	The draft EIS was structured or presented in such a way as to limit the reader's ability to review and comprehend the information, referenced appendices and maps could not be found, and there were multiple errors and discrepancies in the draft EIS table of contents, maps, and appendices. Furthermore, the draft EIS does not provide a concise and clear statement of impacts and issues as required by NEPA. Updated maps showing route changes (including the Blue Ridge Variation), access roads, valve sites, aboveground facilities, and hydrostatic testing sites should be provided. Mapping should be available to landowners and the public in shapefile or a KML format.	Comment noted. The EIS was prepared in compliance with the requirements of NEPA.
General 8	General support for the Project was expressed, based on factors such as economic benefits (e.g., tax revenue, new jobs, new natural gas markets, ability to export gas from Colorado or other gas generating states), energy security and reliability, and environmental benefits (e.g., global transition to cleaner energy, greenhouse gas emission reductions). Safety measures incorporated into the Project's design and environmental mitigation measures are further reasons provided for support. These general comments did not specifically acknowledge the draft EIS nor did they cite specific concerns with information presented in the draft EIS. Additionally, they did not request additional or modified information be included in the final EIS.	The estimated effects of the Project on the local and regional tax revenue, as well as its effects on the availability of jobs in the area, are addressed in section 4.9 of the EIS. A description of the Project and the current safety regulations that govern its design are provided in section 2 and section 4.13, respectively.
General 9	FERC should not issue a final EIS or a decision on the applications prior to receiving all the outstanding information and mitigation measures still to be provided by the applicants or under review by other agencies. The lacking environmental and design information is critical to adequately assessing risks and impacts in the draft EIS and limits the ability of the public to understand the Project and provide comments. Sufficient detail on mitigation measures is also missing.	We acknowledged in the draft EIS that some plans and information have not yet been finalized. While some information was still pending at the time of the issuance of the draft EIS, the lack of final plans does not deprive the public of a meaningful opportunity to comment on draft plans. Final plans are not required at the NEPA stage.
General 10	The EIS conclusions should not be based only on information provided by the applicants and the technical review of the applicant-provided information was inadequate.	Although the applicants did provide information and data related to the proposed Project, we and the cooperating agencies conducted independent analyses as presented in the EIS.
General 11	The data referenced in the draft EIS was old. Use of survey data over 10 years old could lead to incorrect analyses and conclusions.	Data have been updated where available and necessary. However, in some cases newer information is not available or relevant. The EIS complies with the requirements of NEPA and incorporates the best available science.
General 12	The EIS should provide a definitive legal basis for opting to exclude any issue of analysis that was raised during scoping or during the draft EIS comment period. If no legal basis or rationale is provided to exclude topics from consideration, these topics should be addressed in the EIS.	This EIS has been prepared to comply with the requirements of NEPA. This EIS discloses and assesses the potential environmental effects that are likely to result from the construction and operation of the Project. Out of scope issues would be considered and addressed as appropriate by the Commission.

TABLE R-2		
Comments on the Draft Environmental Impact Statement and Responses		
Comment Code	Comment Summary	Response
General 13	The applicants are violating NEPA regulations and the FERC process by pursuing land use applications, permits, and approval decisions, including the land use process as part of the Federal Coastal Zone Management Act (CZMA) program, prior to the NEPA process being complete. These actions limit the choice of reasonable alternatives addressed in the EIS.	Pursuing other land use applications, permits, and approvals prior to completion of the NEPA process does not influence our review of reasonable alternatives. The applicants can pursue other approvals at their own risk and would need to seek amendments or begin the approval process again if the Project's proposal significantly changed as a result of these efforts.
General 14	The EIS should explain the objective evaluation criteria that will be used by FERC to determine if the Project is in the public convenience and necessity and how it meets FERC's Strategic Plan.	See response to comment Purpose and Need 1.
General 15	The depth of the analysis contained in the draft EIS gives greater consideration to aspects of the Project that fall directly under FERC's jurisdiction as defined in the Natural Gas Act (NGA) and the Energy Policy Act than other aspects of the Project having equal or greater impacts that are outside of the scope of the NGA. It is FERC's responsibility to ensure that all impacts are considered and that cooperating agencies provide sufficient information and identification of issues to prepare the EIS. Examples include less consideration of impacts from LNG carrier operations, aviation and wetland mitigation.	The EIS considers environmental impacts of the proposal and discloses available impact information for facilities that are non-jurisdictional to the FERC (e.g., LNG carriers, Southwest Oregon Regional Safety Center, Project Fire Department, Trans-Pacific Parkway widening, and the utility connections for the pipeline facilities). In addition, the EIS supports other federal actions as appropriate including proposed BLM and Forest Service plan amendments, and Section 10/404 permit review by the COE. Cooperating agencies provided input and analysis as appropriate based on their expertise and to support other federal actions. Impacts from LNG carrier operations, aviation, and wetland mitigation are addressed in the EIS where appropriate and at the appropriate level of detail (see for example sections 4.2.1.3, 4.3.2, 4.6, and 4.13.1.3 for LNG carrier operations; sections 4.10.1.4 and 4.13.1.5 for aviation; and section 4.3.3.1 for wetland mitigation).
General 16	The EIS should include a glossary of terms. The EIS frequently mentions risk, but does not adequately define what it means by risk or recognize that what constitutes acceptable risk may vary for different people or population groups. The EIS should provide a definition of the criteria used to make a determination of no significant impact. The EIS should clarify the difference between "block valve" versus "mainline valve."	Terms are defined as necessary when introduced in the EIS. Changes were made in the final EIS to reduce the potential for confusing terms. The criteria used to make a determination of significance is described in the introduction of section 4.0.
General 17	The EIS's assumption that the Project would comply with all federal laws, regulations, land management agency requirements, including FERC regulations, is presumptuous and inadequate to address actual Project impacts and risks. The draft EIS would result in a FERC authorization that may violate a number of federal laws. The EIS should also disclose how the Project would conflict with requirements of state and local laws and ordinances. Waivers during state and local permitting could result in noncompliance with requirements the analysis depends upon; therefore, a supplemental EIS would be required if permits are waived during the process.	As disclosed in section 5 of the EIS, any authorization to construct that we issue would be conditional on applicants acquiring all applicable federal and federally delegated permits. State and local regulation, including local zoning ordinances, is preempted by the NGA to the extent it conflicts with federal regulation, or would delay the construction and operation of facilities approved by the Commission.
General 18	The draft EIS describes reductions in temporary workspace to reduce construction impacts, however, limiting workspace can present a safety hazard to workers if there is not enough room for construction activities, especially at HDD sites.	Reductions in temporary work spaces are not considered to be mitigation; however, we and the cooperating agencies worked with the applicant to reduce the total size of temporary work spaces to the extent needed to safely construct the Project, while still reducing impacts on environmental resources.
General 19	The EIS should consider and address comments from the State of Oregon, Environmental Protection Agency, other agencies, and other commenters.	We have considered and responded to all comments that were filed on the record, as appropriate. For the State of Oregon and the Environmental Protection Agency specifically, see response to comment letters SA2 and FA2 at the end of this appendix.
General 20	FERC is requested to allow comments by intervenors after the final EIS is released and prior to the final decision, specifically to allow comments to any critical new information that may be submitted in data requests and responses after the final EIS is issued and during the 90-day Federal agency review.	There is no time limit for when comments can be submitted on the docket for this Project. We may consider comments filed after the publication of the final EIS as part of an Order the Commission may issue.
General 21	The applicants provided updated information related to their proposed action, requested that revisions be made to the EIS analysis/text, and requested that modifications be made to our recommendations and requirements.	We have incorporated the information and suggested edits from the applicant where they were deemed to be appropriate and in line with federal policies, guidelines, and our analysis.
Purpose and Need		
Purpose and Need 1	There is no demonstrated need, public interest, or benefit from the Project. Oregonians would not benefit from the Project because it is being developed by a Canadian company, LNG would be purchased internationally, the Project would not provide natural gas service to local communities, and the United States instead should conserve its natural gas resources for domestic use. There is no guarantee of benefit to domestic producers, rather, natural gas is more likely to be sourced from Western Canada. There are no binding contracts in place, and it is inappropriate in this case to follow discretionary policy for LNG terminals that allows natural gas to be provided by an affiliate without open access obligations, rate regulation, or regulation of the terms and conditions of service. The draft EIS fails to address the overall economic viability of the Project, the probability of the Project successfully reaching operation if approved, and future price reductions for renewable energy over the lifespan of the Project, which argue against a need for the Project. The draft EIS fails to acknowledge that socioeconomic benefits are not the purpose of the Project and does not disclose the overseas consumers who will benefit from the Project.	The Council on Environmental Quality's (CEQ) regulations for implementing NEPA, at 40 CFR 1502.13, only require that an EIS briefly summarize the purpose and need for a project, which we have done. As described in section 1 of the EIS, the FERC environmental staff and this EIS do not make a final determination regarding the Project's need. For the pipeline component of the Project, need would be established by the Commission when it determines whether the pipeline is required by the public convenience and necessity. The Commission's Certificate Policy Statement (see Certification of New Interstate Natural Gas Pipeline Facilities, 88 FERC ¶ 61,227 (1999), clarified in 90 FERC ¶ 61,128, and further clarified in 92 ¶ 61,094 (2000)) provides guidance as to how the Commission evaluates proposals for new construction, and establishes criteria for determining whether there is a need for a proposed pipeline project and whether it would serve the public interest.
Project Description		
Project Description 1	The EIS should address how the Project would be decommissioned at the end of its lifespan, what impacts decommissioning would have and how the applicants would demonstrate assurance that adequate funds would be available to successfully decommission the Project and restore affected areas. The EIS should discuss the fire risk of decommissioned or abandoned infrastructure left in the fire-prone Project area and the life expectancy of the facilities. The EIS should consider the likelihood of early abandonment or decommissioning due to changes in market forces.	The applicants have no reasonably foreseeable plans for expansion or abandonment of the Project facilities; therefore, it is not appropriate to address these speculative future actions in this EIS. The final EIS has been revised to include this statement (see section 2.8).
Project Description 2	The Jordan Cove Project is dependent on the Port of Coos Bay's proposed Channel Modification project; therefore, modifications to the shipping channel must be considered together with the Jordan Cove Terminal Project as a single federal action under one EIS. The EIS should make a finding with evidence to support a conclusion that the navigation channel expansion is not a related action linked to the Project.	As described in section 1.3.9 of the EIS, the existing navigation channel does not require improvements to support the Project, based on the Coast Guard's finding that "the Coos Bay Channel be considered suitable for accommodating the type and frequency of LNG marine traffic associated with this project." The EIS does, however, examine the potential cumulative effects of the proposed Project along with other projects proposed along or within the watershed of Coos Bay, including the Port of Coos Bay's proposed Channel Modification project.
Project Description 3	The LNG carrier berth and slip would be designed to accommodate LNG carriers that have up to 217,000 cubic meters in capacity;	To date, the applicants have not indicated any intention of accommodating vessels beyond what the U.S. Coast Guard has

TABLE R-2		
Comments on the Draft Environmental Impact Statement and Responses		
Comment Code	Comment Summary	Response
	this indicates that the Project plans to use carrier vessels that have a larger capacity than the maximum 148,000 cubic meters authorized by the U.S. Coast Guard.	authorized. If the applicants decide in the future that they want to accommodate vessels above the maximum size authorized, they would be required to seek a new authorization from the applicable agencies.
Project Description 4	Additional information and analysis on the Direct Pipe installation method for the South Umpqua River should be provided. The EIS should acknowledge that the HDD method was determined to be infeasible for the crossing and disclose there are a limited number of contractors capable of installing a pipeline crossing using the Direct Pipe method.	The Direct Pipe method and its feasibility are addressed in section 2.4.2.2 of the EIS.
Project Description 5	The EIS should address procedures for testing, handling, and disposing of waste drilling mud and cuttings from HDDs. Disposal facilities should be provided.	Disposal of waste drilling mud would be required to adhere to all federal, state, and local requirements, and be disposed of at a licensed facility.
Project Description 6	The draft EIS does not contain sufficient information on the HDD crossings, including but not limited to the geotechnical borings to demonstrate feasibility of the crossings or provide contingency plans and describe alternate crossing measures that may be required. Additional information should also be provided on the feasibility of using the Direct Pipe method to install a large-diameter casing for the east side of the Coos Bay HDD entry point to reduce risk of drilling fluid release.	Additional details regarding the HDD feasibility studies and the geotechnical borings have been added to section 2. Note that Pacific Connector has prepared a Project-specific <i>Drilling Fluid Contingency Plan for Horizontal Directional Drilling Operations</i> to mitigate for an unanticipated release of drilling fluids.
Project Description 7	The draft EIS is deficient because it did not include a complete description of LNG vessel operations, including such factors as their size and draft, how they are fueled and where they will be refueled, and their safety record.	As disclosed in section 2.2.1 of the EIS, the LNG vessels are considered non-jurisdictional components of the Project. The EIS discloses the maximum size and type of LNG vessels that would be authorized to dock at the LNG facility. As disclosed in section 4.13.1.3 of the EIS, the LNG vessels would have to follow the Coast Guard and international laws related to fueling.
Project Description 8	The EIS should disclose if any changes would be needed for the natural gas pipeline system into Malin, Oregon, if the Project is not constructed.	No changes to the natural gas pipeline system into Malin, Oregon, are anticipated to be required whether the Project is or is not constructed.
Project Description 9	FERC should require that the energy needed to run compressors for liquefaction come from new solar or wind energy sources instead of combustion of natural gas.	Comment noted. See section 3.3.6.
Project Description 10	The EIS should include how many miles of access roads will be built for the Project.	The miles of access road that would be required to build the Project are disclosed in the EIS. See section 2.3.2.1, section 4.10, and table D-2 in appendix D.
Alternatives		
Alternatives 1	Renewable energy alternatives should be preferred over the development and export of natural gas.	The purpose of the Project is to transport gas from near Malin, Oregon to Coos Bay, Oregon for export to overseas markets. The generation of electricity for export is not a component of the Project's purpose. Therefore, the use of renewable energy sources would not meet this purpose and was not considered in our review.
Alternatives 2	Support for the proposed route and/or opposition to the Blue Ridge Variation was expressed in comments. These comments stated that the proposed route would cross less private land, require less use of eminent domain, cross fewer waterbodies, avoid high voltage powerlines, and have less impact on aquatic resources compared to the Blue Ridge Variation. There was concern about impact from construction traffic and on property access due to disturbances to Old Wagon Road, as well as disturbances on Coos-Summer Lane. Comments also stated that bird habitat along the Blue Ridge Variation, including potential for nesting marbled murrelet and spotted owl, was not adequately considered relative to the proposed route.	We acknowledge that the Blue Ridge Variation as described in the EIS would increase the number of private parcels crossed as well as the extent of impacts on aquatic resources compared to the currently proposed route, and that there are considerable trade-offs between the variation and the proposed route (as stated in section 3 of the EIS). An alternative to the proposed route is considered preferable if it meets the stated purpose of the Project; is technically and economically feasible and practical; and if implemented would result in a significant environmental advantage when compared to the proposed action. We attempt to balance the overall impacts (and other relevant considerations) of the route variation and the proposed action when making a recommendation regarding which route is preferable. Therefore, recognizing the trade-offs between the proposed route and the variation; the differences between terrestrial and aquatic resource impacts in regard to temporal effects; the scope of potential avoidance, minimization, and mitigation measures for these effects; and the magnitude of the effects, we have determined that the Blue Ridge Variation would result in an overall environmental advantage when compared to the corresponding segment of the proposed route (as described in detail within section 3 of the EIS). Our conclusion is based primarily on the variation's ability to reduce long-term permanent impacts on particularly valuable late-successional old-growth (LSOG) habitat affected by the proposed route. The sensitivity and value of this habitat, as well as the duration of the impact, contribute to this finding. Also, see also our side-by-side responses to IND284 below.
Alternatives 3	The EIS should evaluate the existing gas pipeline and infrastructure currently in place at Cherry Point, Washington, as a reasonable alternative to the proposed action.	The evaluation process for determining reasonable alternatives that are evaluated in the EIS is described in section 3.0. There is no existing LNG infrastructure in place at Cherry Point, Washington.
Alternatives 4	Requests that the EIS assess pipeline route alternatives that would avoid impacts, "avoid my property," or avoid specific features (e.g., water wells) were received, but these general comments did not provide a specific route or details of the route that was being requested.	Pipeline route alternatives are evaluated in section 3.4 of the EIS. In some cases, there is a specific resource crossed that is the focus of the alternative (e.g., federal lands, Coos Bay Estuary, Pacific Crest Trail). In our analysis, we compare environmental impacts between the alternative and the proposed route; however, there are no alternative pipeline routes that would entirely avoid environmental impacts. Without knowing the details of specific locations where commenters have concerns, it is not possible to identify and evaluate alternatives that would avoid these concerns.
Alternatives 5	The EIS should consider alternative locations for the LNG export terminal with less environmental or public safety risk.	Section 3.3 of the EIS describes the process for evaluation of alternative locations for the LNG terminal.
Alternatives 6	The EIS should consider pipeline reroutes that would avoid areas of steep, unstable slopes with heightened landslide risk.	The pipeline route would cross several mountain ranges with steep and rugged topography, and while the applicants have sited the pipeline along ridgelines where feasible to avoid steep slopes and landslide risk, it is not possible to avoid these areas entirely. Our analysis of three route alternatives does consider landslide risk for the alternatives and proposed route; see sections 3.4.2.2, 3.4.2.3, and 3.4.2.5.
Alternatives 7	Other LNG export terminal applications being considered on the west coast of North America should be evaluated as possible alternatives to this Project, including those in Canada and Mexico.	As described in section 3.2 of the EIS, there are no other proposed LNG export (or import) terminals on the west coast of the contiguous United States. Existing and proposed East Coast and Gulf Coast LNG export facilities are located 2,000 to 3,000 miles from Oregon and would not be reasonable alternatives. Section 3.2 of the EIS provides our assessment and conclusions of alternatives that include export facilities in Canada and Mexico.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
Alternatives 8	FERC should choose the No Action Alternative and deny the Project; the draft EIS conclusion is incorrect to find that "it is reasonable to expect that if the Jordan Cove LNG Project is not constructed (the No Action Alternative), export of LNG from one or more other LNG export facilities could also be authorized by the DOE and eventually be constructed. Thus, although the environmental impacts associated with constructing and operating the Project would not occur under the No Action Alternative, equal or greater impacts could occur at other location(s) in the region as a result of another LNG export project seeking to meet the demand identified by Jordan Cove." The draft EIS does not explain or evaluate the impact to consumers of the No Action Alternative.	Comment noted. No impact to consumers is expected as a result of the no action alternative (see section 3).
Alternatives 9	The Project purpose is too narrowly defined for a sufficient consideration of alternatives under NEPA and restricts the identification of feasible alternatives. As a result, the draft EIS is biased toward selecting the applicants' proposed alternative. The alternatives analysis should consider the Project's purpose to be meeting the energy needs of overseas consumers by providing natural gas from North American sources and/or to provide an LNG export terminal on the west coast. There is no rationale for why the purpose can only be accomplished by connecting a pipeline to the interstate transmission system in Malin, Oregon; practical alternatives to the Malin hub and transport by pipeline should be assessed.	The Project's purpose and how it relates to alternatives is addressed in the introduction to section 3.0. As stated in the EIS, the FERC reviews proposals developed by other entities. However, the FERC does not plan, design, build, or operate natural gas infrastructure. Accordingly, the project proponent is the source for identifying the purpose for developing and constructing a project. The Commission cannot simply ignore a project's purpose and substitute an alternative purpose for it that a commenter deems more suitable. The purpose of the Pacific Connector Project is to connect the existing interstate natural gas transmission systems of GTN and Ruby with the proposed Jordan Cove LNG terminal. The only location where the GTN and Ruby pipeline systems interconnect is near Malin, Oregon. Alternatives that do not achieve this purpose cannot be considered as feasible or reasonable alternatives to the Project.
Alternatives 10	Alternative pipeline routes that avoid impacts to environmentally sensitive wetlands of the Coos Bay Estuary are available but have been unduly discounted in the analysis in the draft EIS. The additional mileage to go around wetlands in the Coos Bay Estuary is insignificant in the context of the overall pipeline length and cost of the Project.	Section 3.4.2 of the EIS evaluates alternative pipeline crossings of Coos Bay. The proposed crossing of the bay would be via horizontal directional drilling (HDD), which would significantly reduce the potential for impacts on Coos Bay wetlands.
Alternatives 11	The EIS should present additional analysis of the Humboldt Bay LNG Export Terminal Alternative. The draft EIS indicated the impacts would be similar to the applicants' proposed alternative but failed to conclude which would have fewer impacts or why the Humboldt Bay LNG Export Terminal Alternative should not be preferred over the proposed alternative.	As outlined in the EIS, for an alternative to be found preferable, it must result in a significant environmental advantage when compared to the proposed action. The Humboldt Bay Alternative would not result in a significant environmental advantage; therefore, it is not considered preferable. Furthermore, an alternative that is environmentally comparable or which results in minor advantages in terms of environmental impact would not compel us to shift the impacts from the current set of landowners to a new set of landowners.
Alternatives 12	The EIS is deficient because it uses a different standard to evaluate alternatives than the Certificate Policy Statement used by the Commission to determine whether a project will serve the public necessity and convenience.	The purpose of the Commission's Certificate Policy Statement is to provide guidance for evaluating whether there is a need for a proposed pipeline project; it is not used to evaluate potential alternatives in the NEPA analysis. See also response to comment Purpose and Need 1.
Alternatives 13	The EIS should include analysis and ultimately recommend the applicants incorporate the pipeline route that would avoid or greatly minimize the crossing of Indian Lake Ranch (Snattlerake property), near Trail, Oregon, including the Woods Valley Airport, as shown on maps included with the comment.	Comment noted. Chapter 3 assesses of a reasonable range of alternative.
Alternatives 14	The draft EIS is flawed because it does not evaluate in detail a number of alternatives that were suggested in comment letters filed with FERC during the scoping process.	As stated in section 3.0 of the EIS, all comments concerning alternatives were considered, and many, but not all, of these alternatives are included in this analysis. For example, not included in our analysis is an assessment of renewable energy as an alternative to the Project because these are alternative methods of generating electric power, and the purpose of the Project is not to generate electric power.
Alternatives 15	The pipeline route alternative that co-aligns the route with an existing Forest Service road just north of the Brown Mountain Shelter at the crossing of the Pacific Crest Trail would minimize visual and recreational impacts to trail users. The EIS should re-evaluate the feasibility of following this route.	Comment noted. As a result of ongoing consultations with the Forest Service, Pacific Connector has modified its proposed route in the location of the crossing of the Pacific Crest Trail. The proposed route now follows the existing Forest Service road at the crossing of the trail, and the final EIS has been modified accordingly. See revised final EIS section 3.4.2.9.
Alternatives 16	The pipeline route should be straightened or rerouted to avoid the environmentally sensitive area along the Klamath River between Collins Products and Keno at approximately mileposts 194 to 197 (map attached). The pipeline in this area should also incorporate safeguards and specialized design measures to protect this environmentally sensitive area.	Comment noted. The route in this area was developed to avoid and minimize impacts on Endangered Species Act (ESA) listed species (e.g., Applegate's milk-vetch). Pipeline safety is addressed in section 4.13.
Alternatives 17	The need for the navigation reliability improvement dredge areas should be assessed. Not constructing the navigation reliability improvements would result in minimal impact on the Project's ability to export LNG. An alternative without these improvements should be assessed to minimize dredging impacts.	Comment noted. Jordan Cove has stated that dredging would allow for transit of LNG vessels of similar overall dimensions to those listed in the July 1, 2018, U.S. Coast Guard Waterway Suitability Report, but under a broader environmental window. Jordan Cove has stated that the navigation reliability improvement dredging would allow for greater navigational efficiency and reliability.
Geology and Soils		
Geology and Soils 1	The draft EIS did not include sufficient analysis of landslides, erosion potential and associated impacts on public safety, water quality, and fish habitat to address concerns over landslide risk. The EIS should consider areas of unstable ground on State of Oregon Department of Geology and Mineral Industries (DOGAMI) mapping, address combined environmental risk factors for landslides, provide site-specific detail on where landslides could occur, and require additional safety measures beyond those currently outlined in the draft EIS to ensure the slope stability along the pipeline route. It should be acknowledged that peak risk is 5-15 years after fire or clearcutting when tree roots have decayed but not yet been replaced by new roots.	The effects of landslides and the associated impacts on public safety, water quality, and fish habitat is addressed in sections 4.1, 4.3, 4.5, and 4.13 of the EIS. We have added a recommendation that the applicants should file an updated landslide identification study that includes review of any available DOGAMI landslide studies that were not previously used for landslide identification; and review of the latest available DOGAMI LiDAR data for identification of landslides along the entire pipeline route. The study should also address any specific mitigation that would be implemented for any previously unidentified moderate or high-risk landslide areas of concern. The study should also include the final monitoring protocols and/or mitigation measures for all landslide areas that were not accessible during previous studies.
Geology and Soils 2	Potential failure during hydrostatic testing of the pipeline and resulting downslope impacts from the release of large volumes of water (e.g., erosion, slope destabilization, water quality) should be addressed.	Based on our experience with the construction of thousands of other pipeline projects, the risk of a hydrostatic testing resulting in a catastrophic failure that would be large enough to cause a landslide is very low, and highly unlikely to occur.
Geology and Soils 3	The draft EIS did not include sufficient analysis of earthquake and soil liquefaction risk (especially related to the Cascadia Subduction Zone [CSZ]) and associated impacts to safety, the public and the environment to. Studies cited in the draft EIS (e.g., Wakamatsu et al. 2016, Baker et al. 2012) contradict conclusions (e.g., that welded steel pipelines are not prone to failure due to earthquakes, and that onshore directivity is not expected for CSZ earthquakes). The draft EIS discussion of historical earthquakes	Earthquake risk (including those related to the CSZ) and associated impacts are addressed in sections 4.1 and 4.13 of the EIS. The Wakamatsu study is associated with earthquake damage to a water pipeline. It is noted that pipeline standards for the Pacific Connector pipeline are much higher than for a water pipeline, and the Wakamatsu study noted that much of the water pipeline traversed areas of soft sediments that might have been subject to liquefaction. Liquefaction hazards for the pipeline

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
	does not adequately consider pre-recorded periods. Additional field studies should be conducted to identify buried faults and analyze soils.	have been addressed in section 4.1 of the EIS. The Baker et al. (2012) reference substantiates the conclusion that "no onshore directivity would be expected from subduction events." A sentence regarding the 1700 CSZ earthquake was added to section 4.1.
Geology and Soils 4	The draft EIS did not include sufficient analysis of tsunamis and associated impacts to safety, the public, and the environment. The analysis did not consider the effects of Project dredging and construction on the size or path of a tsunami or analyze tsunami sizes above statistical averages. The EIS should acknowledge that tsunamis occur in sequences and the first is not necessarily the largest. The assessment did not address the effects on the facilities from debris that would be washed up with a tsunami. The complete details of the tsunami modeling should be provided in the EIS.	Tsunami risk and associated impacts are addressed in sections 4.1 and 4.13 of the EIS. The tsunami modeling was conducted to comply with new requirements provided in ASCE 7-16 which indicates that Maximum Considered Tsunami (MCT) events should use the same maximum earthquake criteria used to determine Maximum Considered Ground Motions (and Safe Shutdown Earthquake [SSE] ground motions). In addition, we worked with the National Oceanic and Atmospheric Administration (NOAA) who helped developed tsunami maps for ASCE 7-16, and NOAA determined that inundation elevations from the MCT event for the Jordan Cove LNG Project site were consistent with those determined by Jordan Cove. These tsunami modeling studies were filed with us and are publicly available.
Geology and Soils 5	It is likely that old mines along the Project route have not been identified due to lack of available records, and this may be associated with unidentified mercury contamination.	The likelihood of mines occurring along the pipeline route, as well as potential soil contamination, is addressed in sections 4.1 and 4.2 of the EIS.
Geology and Soils 6	The EIS should consider and address comments provided by DOGAMI.	We have considered and responded to all comments that were filed on the record by the State of Oregon, including those from DOGAMI. See response to comment letter SA2 at the end of this appendix.
Geology and Soils 7	The draft EIS failed to address the effects of a subduction earthquake on deep sections of pipeline installed via HDD.	HDD depths would not be significant in terms of potential earthquake impacts, and earthquake peak horizontal ground acceleration (PGAs) are expected to be the same. Of concern related to HDD installed pipe would be the potential soil liquefaction hazards for HDD pipeline crossings; liquefaction hazards for HDD pipeline crossings are addressed in section 4.1.2.3.
Geology and Soils 8	Best management practices are not enough to prevent erosion resulting in increased turbidity and higher water temperatures in streams. The draft EIS does not provide evidence or demonstrate that proposed measures would be effective in protecting water quality and should address failure of controls. Site-specific plans should be required. FERC should require the applicants' contractor to strip and expose no more than a single day's working area during the rainy season and minimize rights-of-way allowances, especially in riparian areas, to minimize potential water quality impacts from erosion in areas of soil disturbance. Furthermore, the EIS should address numerous deficiencies in the applicants' ECRP that are not in compliance with local ordinances.	The EIS acknowledges that impacts would occur to waterbodies as a result of increased turbidity and temperatures, but we conclude that these impacts would not be significant. BMPs, FERC's Plan and Procedures, the applicants' construction and/or mitigation plans, and agency requirements would be implemented to reduce the scope and intensity of these impacts, but the EIS does not claim that these impacts would be entirely eliminated. The applicants would be required to acquire both federal and state permits related to water quality (e.g., the State's 401 water quality permit). The EIS also addresses environmental compliance and how erosion control devices would be maintained and monitored to maximize effectiveness. The status of major state and local permits is listed in table 1.5.1-1; however, review of conflicts that the Project may have with these permits and authorizations is not within the scope of the federal NEPA analysis.
Water and Wetland Resources		
Water and Wetland Resources 1	The potential effects the Project could have on water resources, including water quality, water wells, and drinking water should be addressed or was inadequately addressed in the EIS.	The potential effects on water resources are addressed in section 4.3 of the EIS. Potential effects addressed include turbidity, sedimentation, spills or leaks of hazardous materials (including inadvertent releases during HDD crossings), temperature effects, spread of invasive aquatic species, disruption of wells (both industrial and drinking), modifications to stream channel integrity, the effects of blasting on hydrology and groundwater, the effects of disturbing potentially contaminated sediments, the effects of proposed dredging activities in the bay, effects of hydrostatic testing and water withdrawals, as well as effects on wetlands (which help to regulate flow and water quality). The effects that water quality impacts could have on fish and other aquatic resources are addressed in sections 4.5 and 4.6 of the EIS. The EIS describes the measures that would be implemented to avoid or reduce impacts on water quality and fish, but acknowledges that some impacts could still occur to these resources.
Water and Wetland Resources 2	Impacts on wetlands, including wetland loss and permanent fill, were not adequately addressed in the draft EIS. Measures to restore wetland hydrology should be addressed and avoidance should be preferred over mitigation. The EIS should also address impacts associated with construction and creation of the wetland mitigation sites and the existing functions and values associated with those sites. The Kentuck mitigation site is inaccurately described in the draft EIS as a pasture but it should be considered a functional freshwater wetland.	The effects that the Project would have to wetlands, including permanent fill, permanent type conversion, as well as temporary impacts and associated mitigation, are addressed in section 4.3 of the EIS. Impacts associated with development of the mitigation sites are disclosed; however, note that we do not consider mitigation measures that offset impacts as components of the proposed action, but instead as actions to offset and mitigate the impacts of the proposed action. We note your opinion regarding the current status of the Kentuck mitigation site.
Water and Wetland Resources 3	Well and drinking water data are incomplete. Adequate analysis of potential impacts on wells, seeps, and springs could not be conducted for the draft EIS because many portions of the pipeline's route have not been assessed using ground surveying methods where landowners have not provided access. The EIS should identify, describe, and analyze all sources of public and private drinking water that could be impacted as well as potential threats. Analysis should include all non-transient non-community surface water and domestic and livestock wells, including all wells mapped by the Oregon Water Resources Department. A site-specific mitigation plan should be provided for each.	The assessment of impacts to wells was based on publicly available data as well as the results of surveys where landowners granted access. The assessment cannot include data related to the presence of wells on lands where the landowner has not granted access as the information is not publicly available. If the Project is approved, these wells, seeps, and springs would be identified and addressed during preconstruction surveys.
Water and Wetland Resources 4	The EIS should address the effects that a reduction in "fog drip" resulting from the clearing of trees within the right-of-way would have to aquifers and groundwater recharge.	Section 4.4 of the EIS addresses the effects that right-of-way clearing and maintenance would have on the microclimate of the affected area. This includes increased desiccation of the affected area due to increased light and wind exposure, as well as a reduction in "fog drip." However, we do not see any evidence that the effects on "fog drip" resulting from the right-of-way would have any appreciable impact on groundwater recharge, and the commenter did not provide any compelling evidence to support their opinion.
Water and Wetland Resources 5	The draft EIS improperly separates discussions of surface water impacts (primarily regarding turbidity, sedimentation and aquatic habitat impacts) from various impact-producing factors (e.g. propeller wash, increased ship traffic, effects of ship wakes on shoreline erosion, dredged material disposal sites, dewatering), instead of considering impacts in total for the Project.	While various impacts are addressed in separate sections of the EIS, these impacts, and our related conclusions, are considered in total for the Project. For example, our evaluation of impacts on surface water quality in section 4.3, and aquatic resources in section 4.5, accounts for the various activities (e.g., dredging, shoreline construction activities, and operational impacts from ship traffic) that would result in impacts on these resources. Our assessment of impacts on aquatic resources takes into account, as appropriate, our assessment of impacts on surface water resources.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
Water and Wetland Resources 6	The draft EIS did not address the risk of invasive species transported by ballast water. The EIS should address what authorities will regulate and monitor ballast water to ensure invasive species are not introduced and if the agencies have the resources to do so effectively.	The Project's potential to transport invasive species through ballast water, the agencies that regulate this, as well as the measures that would be implemented to reduce this risk are addressed in sections 4.3.2 and 4.5.2.
Water and Wetland Resources 7	The EIS should address where freshwater would be sourced and permitted for use by the temporary workforce housing complex and for the LNG terminal during operations. A special use permit renewal may be required.	This information is addressed in section 1 (regarding permits) and section 2 (regarding water sources) of the EIS.
Water and Wetland Resources 8	The draft EIS did not address how the Project's water appropriation will affect water rights, the supply available for existing uses by humans, wildlife and aquatic species, or ecological effects such as saltwater intrusion to the dunes aquifer, thermal changes, reduction in water levels in coastal lakes, and reduced stream flows. Hydrostatic testing and dust control along the pipeline route may impact wells and water availability for other water uses, such as irrigation. The 35 percent reduction in stream flow listed for the Middle Fork of the Coquille River in table 4.5.2.3-6 should not be allowed. The draft EIS should include a condition that requires negotiation of water rights and water use with landowners prior to granting property access or allowing construction.	As discussed in section 4.3, Pacific Connector would obtain all necessary appropriations and withdrawal permits, including from the Oregon Water Resources Department (OWRD), prior to use. Additional text has been added to clarify the State's review process. The final determination of whether the application meets water rights and beneficial uses would be determined by the State during the actual application for withdrawal made by the applicants. Additional text has been added concerning saltwater intrusion and effects to water levels.
Water and Wetland Resources 9	The draft EIS does not provide sufficient detail on waterbody crossing or streambed and streambank restoration measures to ensure mitigation of impacts, nor does it address failure of crossing methods. Open cut crossings during flowing conditions should be prohibited or site-specific mitigation measures for sediment and turbidity should be provided. Mitigation for waterbody crossings should compensate for loss of vegetation to control streambank erosion and the replacement of large trees. Site-specific plans should be provided demonstrating the adequacy of waterbody crossing and restoration methods. Spill control requirements near waterbodies should take into account slope and include containment.	Waterbody crossing and streambank restoration measures are addressed in sections 4.3.2 and 4.5. Establishing mitigation to fully compensate for impacts on waterbodies is not required for NEPA. However, mitigation may be included in the state and/or the COE permits. Failure of proposed crossing methods is also addressed in section 4.3 and section 2 of the EIS.
Water and Wetland Resources 10	FERC should issue a supplemental draft EIS that includes a comprehensive discussion of the methods involved in the construction of the marine facilities and the marine waterway modifications for public comment prior to issuance of a final EIS. The published draft EIS omits data on the composition of excavated materials for the marine waterway modification sites and discussion of underwater blasting required for dredging or channel widening in Coos Bay.	A supplemental draft EIS will not be provided. The methods used to construct the marine facilities and the marine waterway modifications are addressed in section 2 of the EIS. No blasting is being proposed for the marine waterway modifications. Additional details have been added to the EIS concerning the composition of excavated materials.
Water and Wetland Resources 11	The draft EIS does not provide enough detail on hydrostatic testing, or the impacts from and mitigation for these activities. Additional information on the following should be included: locations where test water would be sourced and associated quantities, where water would be discharged or disposed; procedures for testing for contaminants; measures that would be taken if contaminants are found in hydrostatic test water; procedures if there are leaks during hydrostatic testing; frequency of testing; locations and procedures for hydrostatic testing during pipeline operations; procedures for water discharge and disposal; measures to prevent spread of invasive species from test water; responsibilities for property damage as a result of hydrostatic testing activities; and the notification/communication plan to landowners in advance of water withdrawal and hydrostatic testing activities. Additional detail is needed for how the applicants will ensure water is discharged in the watershed where it is sourced. Also, the EIS should clarify what test pressures will be used when Class 2 or 3 pipe segments are adjacent to Class 1 pipe segments and confirm it will comply with U.S. Department of Transportation (USDOT) requirements for all pipe classes.	As discussed in section 4.3, Pacific Connector would obtain all necessary appropriations and withdrawal permits for hydrostatic testing, including from the OWRD, prior to use. Additional text was added to clarify the State's review process. The final determination of whether the application meets water rights and beneficial uses would be determined by the State during the application for withdrawal made by the applicants. As part of this process, OWRD would have the applications reviewed by the Oregon Department of Environmental Quality (ODEQ) and Oregon Department of Fish and Wildlife (ODFW) to determine if there are concerns about the impact water withdrawals may have on water resources (including concerns relating to the timing, seasonality, and method of withdrawal), as well as water quality and/or fish and wildlife species and the habitat, respectively. OWRD would provide public notice and opportunity to comment on the applications. Details regarding the source of water withdrawals and where discharge would occur is presented in section 2 and 4.3 of the EIS. The pipeline would be hydrostatically tested in accordance with the USDOT Pipeline and Hazardous Materials Safety Administration (PHMSA) Minimum Federal Safety Standards in 49 CFR Part 192. See additional discussion in section 4.13.2.1 of the EIS.
Water and Wetland Resources 12	The draft EIS did not address the risk of harmful algal blooms and impacts from green algae growth during construction if stagnant or low-flow conditions are caused by the pipeline crossing. The EIS should also address the potential for temperature increases from vegetation clearing and fertilizer applied for right-of-way restoration to exacerbate risks of harmful algal blooms.	The Project is not anticipated to create low-flow conditions. As a result, algae growth is not an issue for this Project. The potential for stream temperature increase as a result of vegetation clearing within the right-of-way is addressed in section 4.3.2.2 of the EIS, where we conclude that construction and operation of the pipeline would have no discernible effect on stream temperature. The potential for fertilizer to reach streams and contribute to nutrient loading, and measures proposed to minimize that potential, are also addressed in section 4.3.2.2.
Water and Wetland Resources 13	The potential exposure of historic contamination from dredging and construction activity, including any hydraulic changes, should be addressed, with special reference to past lumber mill activity in Coos Bay. The EIS should consider how these contaminants might enter the aquatic food chain. Sediment sampling and analysis to assess contaminants should be required before dredging takes place and dredged material should be tested prior to disposal. The EIS should clarify who is responsible for site cleanup prior to site development for the Project.	Contaminated soils as well as the potential effects on water quality and public health are addressed in sections 4.2 and 4.3. As discussed in these sections, pre-Project sediment sampling has been conducted. The applicant is responsible for site cleanup and restoration.
Water and Wetland Resources 14	The EIS should address the potential impacts of the use of herbicides for right-of-way maintenance on groundwater quality, nearby wells, fish and wildlife.	Herbicide use and measures that would be implemented to reduce adverse effects from their use (e.g., following federal, state, and local regulations, as well as our <i>Upland Erosion Control, Revegetation, and Maintenance Plan [Plan]</i> and <i>Wetland and Waterbody Construction and Mitigation Procedures [Procedures]</i>) are addressed in sections 4.3, 4.4, and 4.5.
Water and Wetland Resources 15	The risk of frac-out or HDD failure in Coos Bay and associated impacts is a concern that has not been adequately addressed.	HDD crossing methods and the potential risk for frac-outs are addressed in sections 2, 4.3, and 4.5.
Water and Wetland Resources 16	The proposed pipeline crossing of the Kentuck Slough wetlands is inconsistent with the FERC's Procedures.	Our <i>Procedures</i> can be modified to address project-specific circumstances/conditions. Modifications to our <i>Procedures</i> are reviewed by FERC staff and, if found acceptable, are approved; see appendix E.
Water and Wetland Resources 17	The EIS should include a description of the applicants' method for installing concrete coated pipe within the Kentuck Slough wetlands, where concrete coating activities would be performed, and whether it would comply with the FERC's <i>Procedures</i> .	The use of concrete-coated pipelines is a standard construction method in wetlands, is addressed in our <i>Procedures</i> , and has been approved for this Project. We can review and approve deviations from our <i>Plan</i> and <i>Procedures</i> as part of the standard variance request process (see appendix E of the EIS). Where the applicants have not requested or have not been granted deviations from our <i>Plan</i> and <i>Procedures</i> , they would be required to comply with the provisions or request a variance.
Water and Wetland Resources 18	The draft EIS did not consider the potential impacts of pipeline construction activities, such as trenching, on drainage patterns and how this could affect water supply (i.e., diverting flow from wetlands), including water availability or water quality for agriculture.	Constructing the pipeline would temporarily affect surface water flow and drainage (see section 4.3 and 4.5 of the EIS). Also, constructing the pipeline would temporarily affect agricultural activities (see discussion in section 4.7 of the EIS).
Water and Wetland Resources 19	The draft EIS did not characterize changes to hydrodynamics and associated effects on water quality that would result from bathymetric changes due to dredging, including the marine berth, and the access channel.	The effects of dredging, including changes in specific site area bathymetry, on flow characteristic and respective water quality in Coos Bay are addressed in sections 4.3.2 and 4.5.2.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
Water and Wetland Resources 20	The sediment transport simulations presented in the draft EIS are not capable of representing the dynamics required for assessment of physical and biological impacts within Coos Bay. A three-dimensional model including the effects of salinity, temperature, and suspended sediment supported by observational data is needed to assess the Project. Increasing seasonal upwelling of low pH water (acidification), sea-level rise, and coastal subsidence expected over the lifespan of the Project were not accounted for in the model. Model validation should be conducted across multiple scenarios and assessment should include pre- and post- Project conditions. Modeling studies should be used to evaluate impacts to salmonids and commercial operations (fishing and aquaculture), not just eelgrass.	The models used a wide range of tidal, depth, and flow conditions in their assessment which are the major driving force in distribution of suspended items and water quality parameters in the bay. The model was calibrated against known water level and current conditions in the bay. Additional recent (2019) models developed by the COE considered much more extensive dredging for the whole navigation channel, and estimated very slight, likely unmeasurable changes over the whole bay in salinity, temperature, or dissolved oxygen. These study results are noted in the revised text. Modeling potentially unknown future changes in ocean water chemistry and water level change effects on bay physical parameters requires an additional set of assumptions that are not justifiable for this level of analysis. Additionally, the assessment of effects to physical, chemical, and biological conditions in Coos Bay relies on many sources, and model results are just one. The level of analysis is appropriate for the NEPA.
Water and Wetland Resources 21	Mitigation presented in the draft EIS for potential permanent impacts to water supplies is inadequate. The replacement of a permanently contaminated aquifer or surface water drinking source would be costly, difficult and in some cases impossible, reducing quality of life and land value.	To address potential impacts on water supplies, Pacific Connector has developed a <i>Groundwater Supply Monitoring and Mitigation Plan</i> . Additionally, should a water supply be adversely affected, Pacific Connector has committed to work with the affected landowner to provide a permanent solution. We conclude that Pacific Connector's commitments are acceptable.
Water and Wetland Resources 22	The EIS should address whether effects on groundwater from building the marine slip and dewatering activities during construction might impact the adjacent Henderson Marsh.	Section 4.3.3.1 of the final EIS has been revised to address potential impacts on Henderson Marsh.
Water and Wetland Resources 23	There are areas of known arsenic and mercury along the Rogue River, which provides public water supply. Inadequate soil testing and analysis has been done to ensure that a frac-out at the Rogue River crossing would not mobilize contaminated sediments. The EIS should address potential drinking water contamination from a frac-out at the Rogue River crossing.	Potential impacts related to frac-out and soil contaminations are addressed in sections 4.2 and 4.3 of the EIS. Additionally, measures to avoid and minimize the impacts of a frac-out would be implemented. Our assessment includes a disclosure of the extent of soil testing for contamination that has occurred, as well as federal and state requirements related to determinations of soil contamination. Measures that would be required if drinking water sources are affected are addressed in detail in section 4.3.
Water and Wetland Resources 24	The draft EIS indicates that the total amount of water needed for dust suppression is unknown; therefore, it cannot support the conclusion that <i>"the overall change in any specific reduction in streamflow from this water use would likely be unsubstantial."</i> Specific quantities to be withdrawn for dust control should be disclosed.	Section 4.3.2 estimates that the rate of instantaneous withdrawal would be a very low. The flow restrictions process is handled through the State permitting with the State determining if the Project is in compliance with the State requirements and OARs during their review of the applicant's State permit applications. The State through this process can implement requirements deemed necessary to meet their permit requirements.
Water and Wetland Resources 25	The EIS should condition use of HDD at other crossings (e.g., Indian Creek) to minimize impacts to waterbodies.	Comment noted. Waterbody crossing methods and resulting impacts are addressed in section 4.3 of the EIS. The assessment was developed with input from cooperating agencies.
Water and Wetland Resources 26	The EIS needs to disclose impacts associated with the proposed protective rock apron west of the access channel (e.g. potential impacts to water quality, beach erosion, flooding and aquatic habitat).	See revised text in section 4.3.2 of the final EIS.
Water and Wetland Resources 27	The EIS should analyze risks to the pipeline and associated facilities from flooding, whether due to periodic weather events or catastrophic dam or levee failure due to an earthquake. Potential for contamination of floodwaters during a flooding event should be evaluated.	The potential effects of flooding on the pipeline are addressed in sections 4.1 and 4.3 of the EIS.
Vegetation		
Vegetation 1	The pipeline right-of-way will not function as a firebreak unless properly maintained by the applicants.	Comment noted.
Vegetation 2	The EIS should consider impacts of groundwater use on rare and important plant communities in the Oregon Dunes National Recreation Area. Impacts to plant communities from groundwater pumping should be monitored.	Information added to section 4.3.1.1. Groundwater withdrawal rates for construction and operation are within the capacity of the CBNBWB well field with minimal drawdown of surface waters modeled. We do not anticipate adverse impacts on the Oregon Dunes National Recreation Area.
Vegetation 3	The draft EIS fails to evaluate the likelihood of successful revegetation. The draft EIS should disclose data from other projects showing predicted and actual time required for full revegetation and stabilization. FERC should require the applicants to pay compensation to landowners if successful restoration is delayed and allow landowners the option of being compensated to do their own restoration.	As noted in the <i>Erosion Control and Revegetation Plan</i> (ECRP), Pacific Connector would conduct follow-up inspections of all disturbed areas after the first and second growing seasons to determine the success of revegetation and would monitor crops for at least two years to determine the need for additional restoration, unless the easement agreement specifies otherwise. Revegetation would be considered successful in upland areas, if upon visual survey the density and cover of non-nuisance vegetation are similar in density and cover to adjacent undisturbed lands. If vegetative cover and density are not similar or there are excessive weeds after two full growing seasons, Pacific Connector would continue revegetation efforts until revegetation is successful. Additionally, as noted in the ECRP, Pacific Connector would work with individual landowners to address restoration of active agricultural areas, such as croplands, orchards, nurseries, and vineyards as well as residential lawns, ornamental shrubs, gardens, and other landscaping affected by the pipeline. In active agricultural areas, Pacific Connector would encourage the landowner to complete final restoration efforts in these areas and would compensate the landowner for these efforts. In residential areas, Pacific Connector would utilize contractors familiar with local horticultural and lawn establishment procedures for reclamation work or would compensate the landowner to restore these areas. Specific reclamation procedures would be determined during negotiations with individual landowners. Pacific Connector consulted with the NRCS and land management agencies regarding recommended seed mixtures for the Pipeline project area. The seed mixtures developed for the Pipeline are based on these agency recommendations and are provided in the ECRP. During right-of-way negotiations, private landowners may also request other seed mixtures than those proposed in the ECRP.
Wildlife and Aquatic Resources		
Wildlife and Aquatic Resources 1	The draft EIS does not adequately address effects of riparian habitat impacts, such as loss of streamside vegetation and water temperature changes, on fish and wildlife, or provide mitigation for these impacts. In addition, this Project would minimize the effectiveness of other stream and riparian restoration/habitat improvement projects being conducted in the area.	The effects that would occur to fish and wildlife as a result of the loss of streamside vegetation (i.e., riparian areas) is addressed in detail within sections 4.5 and 4.6 of the EIS.
Wildlife and Aquatic Resources 2	Impacts to Essential Fish Habitats (including Chinook salmon, Oregon coast coho salmon, sardine, Pacific sand dabs, English sole, starry flounder, lingcod, and rockfishes, as well as their prey) should be addressed and the Essential Fish Habitat Assessment	We acknowledge the need to address effects on Essential Fish Habitats (EFH). As stated in the draft EIS, EFH is addressed in our EFH Assessment, which is attached to our Biological Assessment (BA).

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
	should be provided for review.	
Wildlife and Aquatic Resources 3	The draft EIS failed to adequately address impacts on the southern resident killer whale distinct population segment (DPS) and their primary prey (including coho salmon), as well as general impacts on large whale species such as ship strikes, vessel noise, and construction noise, and did not describe specific mitigation measures in sufficient detail to avoid, minimize, or compensate for the Project's impacts to marine mammals. The EIS should analyze the North Pacific DPS and Mexico DPS for humpback whales separately and update information on gray whale ecology. The draft EIS did not clarify how many ship strikes are considered "infrequent", and the Ship-Strike Reduction Plan referenced in the draft EIS should be provided for comment. The following text from the draft EIS is contradictory: "noise from LNG carriers, dredgers, tugs, and other support vessels could result in behavioral disturbance to listed whales and effects of ship noise on whales could exceed NMFS interim noise exposure criteria for Level B single non-pulse noise (NMFS 2016c, 2017b, 2018c), but LNG carrier noise would not exceed existing background ship noise levels and would not cause injury;" behavioral disturbance and exceedances of noise exposure criteria imply injury. FERC should require use of sound projection within the bow of large vessels to reduce vessel strikes due to sound shadow.	The final EIS has been revised to include the most current available information on ESA-listed cetaceans as directed by National Marine Fisheries Service (NMFS). Additional information is provided in the BA under review by NMFS. The applicants would be required to adhere to standard best management practices (BMP), as well as applicable federal, state, and local requirements in regards to avoidance/minimization/mitigation. If the Project is approved, the approval would be conditional on the applicants receiving all applicable permits and authorizations from federal agencies or state agencies with delegated federal jurisdiction over the Project. This would include authorizations and approvals in the form of a biological opinion (BO) from the U.S. Fish and Wildlife Service (FWS) and NMFS who have authority over mitigation for ESA listed species, marine mammals, and migratory birds. We do not have the jurisdiction to require or impose additional measures (beyond those described in the EIS) on international shipping vessels.
Wildlife and Aquatic Resources 4	The draft EIS does not consider potential impacts on aquatic organisms (e.g. changes in water quality, salinity) from dredging due to possible changes in tidal flow that would result from the proposed channel modifications.	Impacts on aquatic organisms from dredging, including from potential changes in tidal flow, are addressed in sections 4.3, 4.5, and 4.6 of the EIS. Our assessment found that there would be no substantial changes in flow into and out of the bay (see section 4.3).
Wildlife and Aquatic Resources 5	The draft EIS discussion of the recovery time of the benthic community to pre-dredging conditions within Coos Bay misconstrues the cited literature and does not accurately reflect the available data for recovery time on substrates of different grain sizes (i.e., silty versus sandy substrates); therefore, the conclusions do not reflect the expected level of impact for the substrates found in the Project area. The EIS should acknowledge that recovery of benthic communities will not occur while maintenance dredging is ongoing, because the maintenance timeframe is shorter than the expected recolonization period, and that the benthic community recovery will not occur for up to 10 years after dredging ceases. The draft EIS conclusion that impacts of dredging are temporary is not appropriate for describing impacts to longer-lived sessile aquatic species. The quantitative displacement or reduction of current populations of benthic organisms should be disclosed.	The text related to the effects of benthic communities has been edited based on public and agency comments.
Wildlife and Aquatic Resources 6	The draft EIS does not describe impacts to wildlife and aquatic resources in the bay and estuary from dredging, construction activities and vessel traffic. This includes loss of egg-laying habitat due to destruction of eelgrass, cooling water discharges significantly hotter than the surrounding water (up to 19 degrees), marine mammal vessel strikes, impacts on salmon and shellfish from water quality degradation, loss of habitat, noise, impacts in the case of an HDD frac-out and periodic maintenance impacts. FERC should prohibit any water discharges from the LNG facility into the estuary, to avoid thermal and other impacts to aquatic resources. The draft EIS conclusion that impacts will be temporary is incorrect given that maintenance dredging will occur every three to five years.	Impacts on wildlife and aquatic resources in Coos Bay as a result of the Project are addressed in sections 4.5 and 4.6 of the EIS as well as in our BA. Details regarding the temporal nature of impacts are addressed in section 4 of the EIS. Concerns regarding discharges to the estuary are noted.
Wildlife and Aquatic Resources 7	The draft EIS underestimates adverse impacts associated with the loss of rare habitat, such as late-successional old-growth forest. Mitigation for old-growth forest isn't effective because of these habitats take too long to develop the characteristics needed for use by specialist wildlife species.	Impacts on late-successional old-growth forest habitats are addressed in section 4.5 of the EIS and are based on the anticipated disturbance footprint of the Project as well as current literature and science regarding effects of disturbance to these sensitive habitats.
Wildlife and Aquatic Resources 8	The EIS should characterize typical currents applied to the pipeline for cathodic protection and describe potential impacts, including impacts to organisms in freshwater aquatic, estuarine and marine environments. Additionally, the EIS should consider potential impacts to vegetation, soil organisms, and terrestrial wildlife from applied current on the pipe, such as the possibility that it could generate heat or constitute an electrical barrier to wildlife movement.	No impacts on biological resources including wildlife are anticipated as a result of the cathodic protection due to the low voltage and current levels in the system. Pipeline rights-of-way are not barriers to wildlife movement. Furthermore, we are not aware of any adverse impacts that would occur to vegetation or soil organisms due to the cathodic protection system.
Wildlife and Aquatic Resources 9	Impacts to native mud shrimp were not addressed in the draft EIS. The EIS should address this species along with cumulative impacts of an introduced parasitic isopod, <i>Orthoione griffenis</i> , and effects that loss of mud shrimp would have on the ecosystem in the Coos Bay Estuary.	Impacts on native shrimp are addressed in the EIS (see section 4.5), which includes the effects from activities such as dredging of benthic habitats, ballast water exchange, turbidity, etc.
Wildlife and Aquatic Resources 10	The draft EIS failed to consider effects of impacts from sedimentation and turbidity or changes in pH or salinity on oysters (including the Olympia oyster). A mitigation plan for the Olympia oyster should be provided.	Impacts on oysters are addressed in the EIS (see section 4.5).
Wildlife and Aquatic Resources 11	Regarding the discussion of taxa groups in Coos Bay on table 4.5.2.2-1 of the draft EIS: daphnia is a freshwater taxa; the table should include saltwater taxa <i>Podon</i> and <i>Evadna</i> ; the discussion left out important fish such as lingcod, cabazone, greenling, rock fish, cling fish and anchovies; green sturgeon juveniles are in the bay; smolts and adult salmon pass through the bay; the estuaries are an important nursery area and the bay is a recruitment area for Dungeness crab; and <i>Ostrea lurida</i> spawns in the bay.	This table lists the taxa that were collected in the bay near the Project by Shanks et al. (2010 and 2011). This table is meant to be representative of the taxa present.
Wildlife and Aquatic Resources 12	Effects on Black Brant, a declining taxon, that feed on native eelgrass in the estuarine tidal flats of Coos Bay were not considered in the draft EIS.	This species has been added to section 4.6 as a "State sensitive" species.
Wildlife and Aquatic Resources 13	The EIS should address impacts the harbor seal haul-out and pupping area on the lower Coos Bay.	The final EIS has been updated to address potential effects to harbor seals at haul-out sites in Lower Coos Bay (see section 4.5).
T&E Species		
T&E Species 1	The applicants have yet to propose mitigation for some ESA listed species such as marbled murrelet (MAMU), northern spotted owl (NSO), tree vole, and Kincaid's lupine, as presented in the Threatened and Endangered Species section of the draft EIS (i.e., section 4.7).	The lack of mitigation proactively offered by the applicants, beyond general BMPs aimed at avoidance and minimization, was noted in the draft EIS. The final EIS has been updated to note the <i>Comprehensive Mitigation Plan</i> for ESA species offered by the applicant since the draft EIS was published. There is no legal requirement that all impacts on wildlife species (including listed species) be mitigated. We have included recommendations in the EIS (which if the Project is approved would become conditions in the Order) that the applicants adhere to spatial and timing restrictions related to listed species such as the MAMU and NSO.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
		In addition, the FWS and NMFS may include additional protections in their conditions in the BO.
T&E Species 2	The draft EIS did not adequately address potential impact on the endangered shortnose sucker and the Lost River sucker, including how impacts on these fish species would also affect the Klamath Tribes. Specific concerns include adequacy of the Fish Salvage Plan, how application of fertilizer during right-of-way restoration could contribute to high nutrient levels and related juvenile sucker mortality in Klamath Basin waterways.	Impacts on listed species, including listed suckers, are addressed in section 4.6 of the EIS as well as our BA provided to the FWS and NMFS (i.e., the Services). The Services will determine if we have sufficiently addressed and disclosed impacts to ESA listed species. The assessment addresses the <i>Fish Salvage Plan</i> as well as the effects of fertilizer use and measures to be implemented to reduce these effects (see sections 4.3, 4.5, 4.6, and the BA).
T&E Species 3	The draft EIS did not address impact on other special status species from the effects of periodic disturbance for pipeline maintenance activities on symbiotic fungi (e.g., <i>Choironomyces alveolatus</i> , <i>Gymnomyces abietus</i> , and <i>Sedecula pulvinata</i>).	Potential impacts on symbiotic fungi, including <i>Choironomyces alveolatus</i> , <i>Gymnomyces abietus</i> , and <i>Sedecula pulvinata</i> , from the proposed Project are discussed in section 4.6.4.3, table I-5, and appendix F.5 of the EIS.
T&E Species 4	While the draft EIS notes that current federally-designated critical habitat for the Southern Resident DPS will not be affected by the Project, it failed to consider that NMFS has committed to proposing a rule by October 2019 that will expand Southern Resident orca critical habitat to include coastal habitat in Washington, Oregon, and California. This expansion should be considered and analyzed in the EIS.	The final EIS has been edited to address the revised proposed ruling.
T&E Species 5	Additional assessments are needed to determine the presence or absence of threatened, endangered and special status species and migratory birds on private land. Protected species that have been documented on public lands could also be present on adjacent private lands that have not yet been surveyed. Surveys and mitigation for these species, if present, should be conditioned by FERC.	We are consulting with FWS and NMFS under section 7 of the ESA to determine potential impacts on ESA listed species.
T&E Species 6	The EIS should evaluate the impacts to Applegate's milk-vetch, short-nose sucker, Lost River sucker, bald eagle and kit fox in the area where the pipeline is located along the Klamath River.	Impacts on these species that are federally or state listed (i.e., Applegate's milk-vetch, short-nose sucker, Lost River sucker, and kit fox) are addressed in section 4.6. Impacts on the bald eagle are addressed in section 4.5.
Land Use		
Land Use 1	Concerns were expressed from owners of property crossed by the pipeline and access roads about site-specific impacts that would occur on their lands. These comments indicated that mitigation being offered by the applicants may not be sufficient to fully compensate the landowners for these impacts, and that in some cases avoidance should be considered over mitigation or compensation. Impacts cited included direct impacts (e.g., modification or destruction of structures, wells, access roads, or environmental resources, noise during construction, disruption of agricultural operations and livestock grazing, taking of water rights, security measures, and specific impacts from activities such as hydrostatic testing) as well as the indirect impacts (e.g., restrictions on planting, building or subdivision near the pipeline easement or loss of future timber harvest). Long-term maintenance impacts (e.g., disturbance for repairs, testing, and aerial patrols) and future burdens on the property owner (e.g., mowing to reduce fire risk, coordination with the applicants on future work and heavy equipment restrictions) were also a concern. Comments indicated that the applicants' proposal to replant affected vegetation outside of the pipeline right-of-way and provide alternative drinking water if wells are adversely affected would not adequately compensate for this disruption on their lives and properties. Comments expressed concern about additional costs (e.g., repairs and legal fees) if the applicants' contractors do not comply with agreed-upon mitigation measures and potential recourses for landowners. Potential liability of property owners for damage to the pipeline facilities was a concern. Property owners also requested FERC include conditions to require specific easement terms (e.g., conditions relating to specific seed mixes, BMPs, timber sales, use of herbicides, access notifications, placement of pipeline markers).	The applicants would be required to adhere to standard BMPs, as well as applicable federal requirements in regards to avoidance/minimization/mitigation; however, landowners can also negotiate additional avoidance, restoration, and mitigation efforts to be implemented on their lands during construction, restoration, and/or operation as part of their easement negotiation with the applicants. See also response to comment Land Use 3.
Land Use 2	Proposed HDD crossings could result in toxins and/or HDD drilling fluids being deposited on landowners' properties.	HDDs and the potential effects of inadvertent releases of drilling fluids are discussed in sections 2, 4.1, 4.2, and 4.3 of the EIS.
Land Use 3	The draft EIS analysis of impacts on private lands, which account for the bulk of the Project impacts, are woefully inadequate when compared to the far more robust discussion of effects on public lands. The draft EIS should provide or condition site-specific mitigation plans and controls for private lands addressing, for example: waterbody crossings and restoration, dewatering, stormwater runoff, washing stations, refueling and chemical storage areas, equipment leaks, fire prevention, tree protection, invasive species control, residential construction (for all properties) agriculture, livestock, and locations where the pipeline is within 50 feet of a potable water source. The draft EIS statement in section 2.1.7 that " <i>though initially developed for federally-managed lands, most of the POD attachments apply to non-federal lands as well</i> " does not clearly identify which mitigation measures apply to non-federal lands.	The EIS generally evaluates impacts on private lands and resources that occur on private lands at the same level of detail as federal lands. For example, see the EIS discussions and analysis (including tables of existing resources) for impacts on water resources and wetlands, soils, transportation (access roads), and land use including agriculture and grazing. The exception is the evaluation of impacts on resources that have a direct effect on federal land management plans, which are evaluated at a level of detail required to support review of possible plan amendments. It is outside the scope of this EIS to evaluate individual impacts on each private parcel crossed or to require or establish landowner-specific mitigation plans for all resources. As stated in the EIS, the applicant is required to work with the landowners to identify any mitigation measures that specific landowners would require on their lands that are beyond those currently outlined in the EIS.
Land Use 4	FERC should acknowledge that the majority of landowners with property crossed by the pipeline have signed voluntary easement agreements.	Comment noted.
Land Use 5	A proposed access road and the pipeline may impact the safe operation of the airstrip on the Snattlerake property/Indian Lake Ranch near Trail, Oregon.	Potential impacts on the airstrip, called the Woods Valley Airport in the EIS, are addressed in section 4.7.2.4 of the EIS.
Land Use 6	Appendix J only lists seven residences with site-specific mitigation plans, none of which are in Jackson County. With 252 landowners along the entire route and 25.6 miles of private lands being crossed in Jackson County as shown in table 4.7.2.1-1, there are certainly more residences than those seven that will be impacted enough to require site-specific mitigation. The criteria used to determine the seven listed was "located within 50 feet," which seems arbitrary.	The applicants would implement numerous measures to reduce impacts on residences. We typically require applicants to develop site-specific plans for any residence located within 25 feet of construction workspace, including access roads. The 25-foot requirement is used routinely across the country; however, we increased the distance in this project to account for region specific residential density.
Land Use 7	Farm land cannot be taken for non-farm uses, in accordance with State laws.	Comment noted.
Land Use 8	FERC should be responsible for making sure that the applicants comply with their agreements with landowners. The EIS should specify the process and point of contact with Commission staff to report violations and seek relief.	See section 2.6, as well as recommendation 10 in section 5.
Land Use 9	The EIS should clarify the statistics that have been presented for the easements that have been granted by landowners to the applicants. The EIS should clearly present the following as a percentage of the total affected: parcels signed, total miles signed,	Comment noted.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
	total acres signed and total unique landowners signed. This data should be provided including the FERC-recommended Blue Ridge Variation route. FERC should independently substantiate these data to provide a determination of the number of landowners who would be subject to eminent domain if the Certificate is granted.	
Land Use 10	The EIS should clarify the ownership of the land underneath the water in Coos Bay and who would be responsible for granting the easement.	The Oregon Department of State Lands (ODSL) controls the lands under the water. The applicant would be required to acquire a lease from ODSL for actions that would impact aquatic habitats in the bay (see table 1.5.1-1 in section 1 of the EIS).
Land Use 11	Section 4.7.2.4 of the draft EIS indicates that the applicants communicated with Coos County, the City of North Bend, Douglas County, Jackson County, and Klamath County to identify any large-scale residential, commercial, or business projects/planned developments within 0.25 miles of the pipeline; however, Jackson County does not have records of receiving such a request. "Large-scale" should be defined.	Comment noted. The referenced correspondence with Jackson County is provided in Jordan Cove's Final Resource Report 1 application to the FERC, Appendix B.1, Attachment C.1 (pp. C-124 to C-133). "Major" projects are defined in the document provided to Ted Zuk, Interim Development Services Director, via email on June 16, 2019 (see page C-127 of the above-referenced appendix). Major projects and large-scale projects are synonymous in this context. Major or large-scale projects are defined as: "Projects that will cause significant ground disturbing activity (i.e., planned subdivisions and housing developments, new construction of stores and restaurants, larger road projects). Examples of projects not considered 'major' would be an individual requesting modification to their home and traffic light and sign work."
Land Use 12	The EIS should address any potential impacts to the educational and research work of the Oregon Institute of Marine Biology (OIMB) in Charleston, Oregon, across the bay from the proposed Project, and should consult with OIMB. The EIS should also address and consult with NOAA on any impacts to the South Slough of Coos Bay which is part of the National Estuarine Research Reserve System.	Impacts on researchers and students at the OIMB are expected to be similar to those described for recreation users in the EIS, including recreational boating and fishing (see section 4.8.1.1). NOAA is a cooperating agency in the development of the EIS and the analysis herein.
Land Use 13	The draft EIS did not address privacy and security concerns for residents. Security monitoring, including use of cameras or drones around the LNG facility and flyovers of the pipeline route, would invade the privacy of residents, including residents who are not directly affected landowners. Additionally, the EIS does not provide mitigation measures that would ensure property security during construction, such as background checks for workers, or during operations, such as unauthorized off-road vehicle use or rights-of-way.	Jordan Cove has not identified the use of drones as a security measure for the terminal site. Aircraft flyovers of the pipeline route would be conducted periodically. While some residents may consider this intrusive, potential impacts on privacy are expected to be limited and are not considered in the EIS. Potential impacts on public safety during pipeline construction are addressed in section 4.13.2.3 of the EIS. Affected property owners with concerns about the construction workforce should address them directly to Pacific Connector.
Recreation		
Recreation 1	The draft EIS did not adequately address the consequences of noise and visual impacts to recreation on the North Spit of Coos Bay.	The potential effects of LNG Terminal construction-related noise on the North Spit of Coos Bay are assessed in section 4.8.1.1 of the draft EIS. Visual impacts are assessed in section 4.8.2.1.
Recreation 2	The draft EIS failed to identify the existence of several non-consumptive recreational activities in Coos Bay (beachgoing/combing, stand up paddling, kayaking, diving, wildlife viewing, boating, photography, fishing, recreational sailing, and general aesthetic enjoyment), and did not address potential impacts on these activities in addition to the surfing and diving activities that were acknowledged in the EIS. Unique diving and surfing sites should be addressed. The Project impacts on these recreational activities, including safety concerns, would result in long-term adverse impacts on tourism and livability of the region, including areas around Cape Arago and the North Spit.	Potential impacts on boating and fishing are assessed in section 4.8.1.1 of the draft EIS. Potential impacts on recreational activities related to dredging are addressed in section 4.8.1.1 of the final EIS, specifically with reference to clamming and crabbing. This discussion has been expanded to include other types of water-based recreation activities in Coos Bay. Impacts on ocean-going recreational non-motorized vessels in Coos Bay resulting from Project-related ship traffic would be similar to those from current deep-draft cargo ship traffic in the Federal Navigation Channel. All LNG carriers visiting the Jordan Cove terminal would have to adhere to Coast Guard regulations, including anchoring procedures offshore, in addition to the measures outlined in the Waterway Suitability Assessment, Waterway Suitability Report, and Letter of Recommendation. A pilot would board the LNG carrier to guide it through the Coos Bay navigation channel, and the vessel would be accompanied by tugs and security escort boats to keep it on course. In general, as a deep-draft vessel enters the channel, other vessels move out of its way. The escort boats accompanying each LNG carrier would facilitate moving other boats and non-motorized out of the way in a timely manner. As they currently do for other commercial cargo ship traffic, the Coast Guard and Oregon State Marine Board would remind recreational boaters of their obligation to not impede deep-draft vessels transiting in the Federal Navigation Channel. The EIS used the latest available information to summarize the local economy and assess potential impacts to the recreation and tourism and other economic sectors in the Coos Bay area. Additional information related to travel-generated spending on recreational activities in Coos County, including shellfishing, fishing, hunting, and wildlife viewing, has been added to section 4.9.1.7 of the final EIS.
Recreation 3	The draft EIS cites the Oregon State Marine Board, which identified 105,000 boater use days in Coos County in 2013. Therefore, the statement from the Coos Bay Pilots, also cited in the draft EIS, that they currently encounter approximately 6 recreational boats during transit into and out of the Port must be incorrect.	The final EIS text has been edited to remove this reference.
Recreation 4	The impact to crabbing activities will be more significant than has been described, due to the need for crabbers to pick up gear, sort, and release crabs before they can relocate to avoid a transiting tanker, since crab rings are considered a safety hazard to vessels.	See additional text provided in sections 4.9 and 4.10.
Recreation 5	The EIS should discuss use of the Boxcar Hill campground and the Boxcar Hill sand dune area for construction and operation of the Project, and associated impacts on recreational activities.	The Boxcar Hill Campground is identified as a laydown area in multiple places throughout the EIS. Use of the campground as a laydown area would preclude its use as a campground and affect recreational use of the property, including off-road special events, such as the UTV Takeover. This information has been added to section 4.8.1.1 in the final EIS.
Visual		
Visual 1	The EIS should address Project effects on the visual landscape (e.g., effects on viewsheds in the area). The Project would degrade the viewshed and result in visual "scars" within forested habitats.	The potential effects on visual resources are addressed in section 4.8 of the EIS. As disclosed in section 4.8, the maintenance of the pipeline right-of-way would result in a permanently cleared area in forested habitats, which would be visible from some locations.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
Visual 2	Visual simulations provided in appendix K of the draft EIS are misleading and do not represent what would be seen by observers. Photos should not be taken with a wide-angle lens. Moreover, simulations include conditions that would not be realistic, such as allowing large woody vegetation to grow within the permanent right-of-way.	Comment noted. Simulations are not actual depictions. These simulations provide a possible outcome. The visual simulations are to inform the reader. Our conclusions regarding impacts on visual resources are based on numerous factors, one of which are the visual simulations.
Visual 3	The impact of night-time lighting of the LNG facility and tankers will be much more impactful than the draft EIS suggests. Hooded lighting fixtures will have little effect giving the reflectivity of light-colored tanks and infrastructure. Light pollution would affect residents and permanently degrade sunset views. The Project should be required to comply with dark sky objectives.	Although the comment stresses the characteristics of night lighting that would be associated with the LNG terminal, it appears to be generally consistent with the draft EIS discussion of incremental lighting impacts in an area with extensive urban uses. The text of section 4.8.2 has been revised in the final EIS to clarify the expected conditions with regard to lighting. The EIS concludes that visual impact in Coos Bay would be significant. Also, see also our side-by-side responses to CO32 below.
Visual 4	The draft EIS did not address the visual impact from the mounds of dredge spoil that would be placed near the historic McCullough Bridge crossing Coos Bay. This would have a negative impact on residents and visually sensitive areas within ½ mile of the disposal sites.	Figure K-6 in the draft EIS provides a simulated view from the southern end of the McCullough Bridge that includes what we consider to be a realistic depiction of the simulated condition for the APCO dredge disposal sites. Also note that the existing view in Figure K-6 demonstrates that the landscape as seen from this location has already been substantially modified through previous human development activity. The EIS concludes that visual impact in Coos Bay would be significant. Also, see also our side-by-side responses to CO32 below.
Socioeconomics		
Socioeconomics 1	The EIS should address the possibility that the export of natural gas would raise local consumer prices by 36 to 54 percent as well as threaten U.S. jobs where U.S. factories depend on natural gas. Comments to this effect cited a report by the U.S. Department of Energy (DOE) as the source of these concerns but did not provide the title of the report or the year in which it was published. Because of the unique pipeline configuration in the Pacific Northwest with only two principal sources of natural gas feeding that market, tying up long-term firm transportation capacity of southern-bound Canadian gas would remove resiliency from the Pacific Northwest pipeline system and cause significant cost increases to U.S. consumers.	The comments concern impacts associated with the exportation of LNG and are not specific to the Project. Economic impacts associated with the exportation of LNG are analyzed by the U.S. Department of Energy, not the Commission.
Socioeconomics 2	The EIS should address the effects that “man camps” and the influx of non-local workers to the local communities could have to crime levels, housing availability and cost, public health, and public resources. There are concerns regarding the disproportionate effects on women and tribal communities, based on studies of impacts from other communities impacted by oil and gas extraction.	The effects to the local communities from the influx of non-local workers, including effects on crime, housing, and public services, are addressed in section 4.9 of the EIS.
Socioeconomics 3	The EIS should address the effects that the Project would have to landowner’s property values and require a new, independent economic study of property value impacts. The draft EIS analysis on property values is flawed due to issues with cited studies, such as dissimilarities of previously studied communities and the Project area, or outdated information (e.g., recently increased public awareness of LNG and pipeline safety risks). The EIS discussion of property values should also take into account loss of value from landowners’ planned improvements that cannot be developed in conjunction with the easement.	The potential impacts of the Project on property values are assessed in sections 4.9.1.3 (LNG Terminal) and 4.9.2.3 (Pipeline). The assessment draws upon available studies to assess the scope of these potential impacts. For the LNG Terminal in particular there are limited studies to draw upon, as noted in the EIS. An assessment of the “loss of value from landowners’ planned improvements” would be speculative, as the extent of all landowner planned actions could not be known.
Socioeconomics 4	The EIS should disclose the number of workers that would actually be employed as a result of the Project’s construction and operation.	The estimated numbers of workers that would be employed during the construction and operational phases of the Project are provided in sections 4.9.1 (LNG Terminal) and 4.9.2 (Pipeline) of the EIS. The EIS distinguishes between temporary and permanent jobs, and provides estimates of the number of workers who would be hired locally versus those who would be non-local and would temporarily relocate to the area for the duration of their employment.
Socioeconomics 5	Potential economic impacts of LNG carrier traffic due to shipping lane closures or the need for other vessels to avoid LNG carriers in transit, especially at high tides, should be addressed. The potential impacts on the Dungeness crab fishery were of particular concern, due to the limited tidal window that crab fishing occurs centered on high tide.	Potential impacts to commercial fishing, including the Dungeness crab fishery, are discussed in section 4.9.18 of the EIS. Most of the high-use crabbing areas are not directly in the navigation channel and, generally, crabbers would not be excluded from most harvest areas.
Socioeconomics 6	The EIS did not address all the economic costs to existing industries (e.g., tourism, fishing, agriculture) and landowners associated with the Project and its environmental impacts. State and local governments could also incur economic costs that have not been considered. Recent growth in the service and recreation industries means a new, peer-reviewed economic feasibility study is needed.	Impacts to other industries, including recreation, tourism, and commercial fishing, are addressed in section 4.9 of the EIS. Potential impacts to public services are discussed in sections 4.9.1.6 (LNG Terminal) and 4.9.2.6 (Pipeline).
Socioeconomics 7	The draft EIS concluded that the “Project would provide direct employment for local workers, support jobs and income elsewhere in the local and state economies, and generate tax revenues for local, state, and federal agencies.” This conclusion is flawed because the majority of jobs created would be temporary and staffed from out-of-state, and the draft EIS overstated economic benefits relative to the Project’s negative impacts to landowners, the community, and the environment. FERC should condition the Project to ensure corporate tax revenue structure benefits Oregon and the United States.	<p>Comment noted. The Project would provide direct employment for local workers, support jobs and income elsewhere in the local and state economies, and generate tax revenues for local, state, and federal agencies, as stated in the cited text. Employment generated and supported during the construction phase would be temporary. As discussed in the EIS, Jordan Cove estimates that on average about 21 percent of the construction workforce for the LNG terminal would be local hires (i.e., workers who normally reside within daily commuting distance of the terminal site). For the Pipeline, on average an estimated 36 percent of the construction workforce would be local. Jobs supported by the Project elsewhere in the local economy would primarily be occupied by people who reside in the area. Following construction, operation-related employment would be permanent (for the life of the Project) and would include workers employed directly by the Project, as well as jobs supported elsewhere in the local economy. This is discussed further in section 4.9 of the EIS. The requested “condition” is outside the scope of authority for this EIS.</p> <p>Potential effects to landowners, the community, and the environment are discussed in detail in section 4 of the EIS.</p>
Socioeconomics 8	Additional information on the effect of the temporary workforce housing availability within Coos County should be addressed. Temporary workers would impact rental rates and could exacerbate the existing deficit in affordable rental units, and this impact would last beyond the timeframe of proposed construction activities. The draft EIS cites Jordan Cove’s proposal to use a temporary workforce housing facility to help alleviate potential impacts on housing, but does not require that temporary employees stay in this facility.	<p>Potential impacts to housing resources are addressed in sections 4.9.1.2 (LNG Terminal) and 4.9.2.2 (Pipeline) of the EIS. Section 4.9.1.2 assesses the potential for Project-related demand for temporary housing to affect the available supply and cost of temporary housing resources, including rental housing and hotel and motel rooms. The workforce housing facility has been proposed to provide temporary housing for construction workers and is expected to reduce demand of other types of temporary housing resources in the surrounding area.</p> <p>As described in section 4.9 of the draft EIS, when the combined effects of the Jordan Cove LNG Project and Pacific Connector</p>

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
		Pipeline Project are taken into consideration collectively, construction of the Project has the potential to cause significant effects to short-term housing in Coos County. In the event that rental prices rose in response to the increased demand, these impacts could include potential displacement of existing and potential residents, in particular low-income residents, as well as tourists and other visitors. In order to reduce the potential for these types of impacts, we have added a recommendation to the final EIS that the Applicants designate a Construction Housing Coordinator who would coordinate with contractors and the community to minimize impacts to housing availability in the affected communities.
Socioeconomics 9	The draft EIS failed to adequately address Environmental Justice. Environmental Justice for Native American tribes should consider that indigenous nations would suffer disproportionate impacts on their traditional economic and cultural practices. The Project will have also have disproportionate impacts to communities of color and disenfranchised populations. The draft EIS did not provide for effective community participation for affected landowners who are disproportionately low-income and elderly. The EIS should acknowledge that economically disadvantaged populations rely disproportionately on the environmental resources such as the fish and shellfish populations.	Section 4.11 of the EIS evaluates the potential for the Project to negatively affect tribal populations and traditional economic and cultural practices. The results of this analysis are considered through the lens of environmental justice in sections 4.9.1.9 (LNG Terminal) and 4.9.2.9 (Pipeline). Sections 4.9.1.9 and 4.9.2.9 also consider impacts to other potential environmental justice populations, as appropriate. Section 1 of the EIS discusses the efforts made to facilitate effective community participation, including with landowners.
Socioeconomics 10	The draft EIS failed to acknowledge that the Jordan Cove facilities would be built in an Enterprise Zone, subject to Coos County property tax exemptions. The draft EIS does not address the differences between the applicants' planned contributions to the Community Enhancement Plan in Coos County and the payment of property taxes, in terms of the dollar value, who controls the appropriation, and where the money would ultimately go. The EIS should include quantitative analysis of the scale, timing and duration of benefits from the Community Enhancement Plan.	As stated in section 4.9.1.5 of the EIS, the LNG Terminal would contribute to the fiscal health of local communities through a local Community Enhancement Plan in Coos County. It is not within the scope of this EIS to assess the effectiveness or relative merits of the Bay Area Enterprise Zone, where the proposed LNG Terminal would be located.
Socioeconomics 11	The EIS should address the effects of a "boom-and-bust" economy on the local community.	The term "boom and bust" economy is typically used to describe a repeated pattern of economic expansion and contraction, rather than the impact of a single large construction project. Construction-related impacts are assessed for the LNG Terminal and Pipeline in sections 4.9.1 and 4.9.2 of the EIS, respectively. During construction, the non-local workforce would temporarily peak and then gradually decrease until construction is complete. Local economic impacts from increased demand for local goods and services would follow a similar decrease, generally allowing local businesses time to adjust to reduced demand as the Project concludes. The transition from construction to operation is generally not expected to result in adjustments to the provision of local government services.
Socioeconomics 12	The EIS need to take into consideration the potential economic benefits (including job creation) the Project could have for other western states (e.g., Colorado and Utah). The draft EIS failed to consider national energy security implications or geopolitical benefits.	Such an assessment would be speculative, as there is no clear evidence that the Project would or would not have economic benefits to other states. National energy security implications and geopolitical benefits are outside the environmental scope of this EIS.
Socioeconomics 13	The EIS needs to consider whether water use by the Project would lead to higher water prices and associated economic impacts.	Jordan Cove would obtain water from the Coos Bay-North Bend Water Board to construct and operate the proposed LNG Terminal, as discussed in section 4.3.1.1 of the EIS. There is no evidence to support the claim that the limited and temporary water use by the Project would have an effect on water prices.
Socioeconomics 14	Hospital and emergency services available in the area are inadequate to serve the Project during construction and operation. The area lacks qualified first responders and the hospital facilities does not include a nearby Level I trauma center. The EIS should provide a thorough assessment of the impact on existing medical facilities, including potential need for substance abuse, mental health, and other health treatment services. The applicants should be responsible for building or supporting medical facilities.	Medical facilities and emergency services are addressed in section 4.9 of the EIS. The closest hospital to the LNG Terminal site is the Bay Area Hospital in the city of Coos Bay, a Level 3 Trauma Center. As discussed in section 4.9.1.6 of the EIS, Jordan Cove has committed to building and funding the Southwest Oregon Regional Safety Center within the Jordan Cove LNG Project site. In addition, Jordan Cove and the State of Oregon have entered into a Memorandum of Understanding and Agreement for "LNG Emergency Preparedness," as noted in section 4.9.1.6. This section of the EIS also discusses the on-site provision of medical and emergency services that would be provided during Project construction and operation.
Socioeconomics 15	FERC should provide a quantitative cost-benefit-risk analysis of the Project as a whole, conducted by a qualified professional.	There is no requirement under the NEPA to prepare a quantitative cost-benefit analysis of a proposed action and we do not typically include this type of analysis as part of our NEPA analysis. The potential socioeconomic impacts of the Project are assessed in section 4.9 of the EIS.
Socioeconomics 16	The EIS should include in its analysis of socioeconomic benefits the effects of modernization of the Coos Bay Port, the development of the Southwest Oregon Regional Safety Center, and other infrastructure upgrades resulting from Jordan Cove's voluntary agreement.	The economic impacts associated with Project-related improvements to infrastructure are generally captured in the regional economic impact analysis, which assesses the secondary (indirect and induced) economic impacts of the proposed Project based on in-state Project-related expenditures.
Socioeconomics 17	Given that the AI Pierce Company (APCO) dredged material disposal sites are some of the largest land parcels zoned for industrial use within the City of North Bend, the EIS should evaluate socioeconomic impacts from potential loss of value and or reduction in suitability of these sites for future industrial development following placement of dredged spoil.	The APCO sites are privately owned by a third party (as indicated in section 4.8) and are used for dredge disposal. Disposal of dredged materials at these sites does not preclude them from future use.
Socioeconomics 18	The EIS should acknowledge and discuss the social and economic effects of a decade of uncertainty over the development of this Project. The Project has already contributed to social and mental health impacts to the population of affected landowners and stakeholders and contributed to economic uncertainty to the region.	Comment noted. The impacts of previous project iterations are generally outside the scope of this analysis.
Socioeconomics 19	The draft EIS does not address the impact that pipeline construction and use of herbicides on the ability for landowners to practice organic farming or apiculture.	Private landowners would be able to negotiate the Project maintenance requirements related to herbicide use on their lands. As a result, there would likely be no effect from the Project on a farmer's ability to practice organic farming.
Socioeconomics 20	The durations used to evaluate impacts as described in the introduction of section 4 of the draft EIS (temporary, short-term, long-term, and permanent) are not terms of art used in economics and are irrelevant for the economic analysis of the EIS.	These impacts are appropriate for the socioeconomic review in the context of the NEPA. Further, the socioeconomic analysis in section 4.9 uses other measures of duration where appropriate for the specific analysis (e.g., the 53-month construction period, first full year of operation, annual spending or earnings, fiscal year, etc.).
Socioeconomics 21	On page 4-600, table 4.9.1.9-1 the draft EIS lists low income population as 37 percent of the North Bend population and 46 percent of the Coos Bay population. This is simply a snapshot and of virtually no use. The draft EIS ignored the vast amount of research by Chetty, Hendren, and Katz (2016).	The cited table reports the demographic indicators provided by the U.S. EPA's EJSCREEN model for communities in the vicinity of the LNG terminal site. These indicators are part of the assessment used to determine if there are potential low-income populations near the site. This analysis is explained further in section 4.9.1 of the EIS.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
Socioeconomics 22	The EIS should address worker health impacts for both temporary and permanent employees, such as noise, exposure to emissions, exposure to dust, and risk in the event of an emergency. Occupational Safety and Health Administration (OSHA) regulations are inadequate to ensure worker health and safety for this Project.	The Occupational Safety and Health Administration (OSHA) is responsible for protecting worker health.
Socioeconomics 23	The draft EIS did not consider how the sudden influx of timber for sale from public and private land when the right-of-way is cleared will affect the market value of timber. The EIS must also address the permanent loss of economic value of the right-of-way for timber production.	Based on the annual average volume of timber harvested in the four counties from 2011 to 2016 (1,047 million board feet), volumes removed along the right-of-way are expected to represent a relatively small share of annual average volumes harvested. The loss of economic value from the permanent removal of timber would be addressed with landowners as part of their easement negotiation with the applicants.
Socioeconomics 24	FERC should require the applicants to pay bonds or into an escrow account to ensure that their contractors get paid in the case of the applicants going bankrupt during the construction process. The EIS should also require bonding to address the applicants' ability to pay for any damages resulting from the Project facilities in the case of a catastrophic event or violation, ensure the applicants cannot declare bankruptcy to avoid those costs, and clarify the legal entity or entities would have authority for enforcement and recovery of damages. The applicants should be required to fund risk bonding for climate or natural hazard risk trust fund to offset public costs associated with the Project. Performance bonding for the mitigation projects should be required.	We do not require companies to post bonds.
Transportation		
Transportation 1	The EIS should address the possibility that the Project's use of local access roads could result in landowners or emergency vehicles being unable to access their properties. Use of access roads by construction vehicles, including private ranch roads, could endanger landowners including small children.	Potential impacts to access roads during Pipeline construction are assessed in section 4.10.2.1 of the EIS. Impacts from additional Pipeline construction-related traffic on local roads are assessed in section 4.10.2.2. Impacts on affected roads and users would be reduced through the implementation of the measures described in Pacific Connector's <i>Transportation Management Plan</i> (see section 4.10.2.1). Use of private access roads for construction vehicles, and terms of that use such as notification requirements, would be allowed only if the applicants negotiate an agreement with the affected landowner.
Transportation 2	The draft EIS fails to adequately address air traffic hazards and impacts to airport operations during construction and operation of the Project and specifically, the Federal Aviation Administration's (FAA) finding of excessive stack heights of LNG carriers. The EIS should clarify the heights of all of the different ships that may be used and ensure that they are included in the FAA review. The future expansion of North Bend Airport Runway 4-22 should be taken into consideration. The EIS should also consider environmental impacts (such as air emissions) from idling or waiting aircraft.	The FAA's current findings are disclosed in sections 4.10 and 4.13 of the EIS. We defer to the FAA on air traffic hazard impact determinations. The proposed expansion of the runway is addressed in the cumulative effects section (see section 4.14).
Transportation 3	The EIS must clarify the safety buffer distance that other vessels will need to maintain from LNG tankers, and address the impacts of that distance to the movement of other vessels within the channel. Specifically, the effects on the movement of other vessels at slack high tides should also be addressed in the EIS. The estimate of a 30-minute delay to recreational boating is inaccurate and has not been studied with realistic scenarios. Channel closures could pose an additional safety hazard to commercial and recreational vessels, including non-motorized vessels that may not be able to respond quickly, by forcing them to wait at sea or traverse the channel in sub-optimal conditions.	Additional details have been added to sections 4.9 and 4.10 of the EIS. During LNG carrier transit in the waterway to the terminal, a Coast Guard safety and security zone may be implemented. Non-LNG vessels would be allowed to transit through the safety zone and would also be allowed in the safety zone during passage provided that these other vessels do not impede the safe navigation of the LNG carriers in the restricted channel, and that the other vessels do not pose a security threat or concern to the LNG carriers in transit. The timing and constraints associated with LNG carrier transit through the channel entrance bar area would be similar to existing constraints on chip ships and log carriers calling at the port. Note that the LNG marine traffic would overlap with the portion of the navigation channel used by the ocean-going fishing fleet from Charleston for about 2 miles. There may be slight delays resulting from meeting situations between an LNG carrier and a commercial fishing vessel, because of the security and safety zones or other conditions imposed by the Coast Guard. Jordan Cove has indicated that the impact on boats at any point in the channel would last about 20 to 30 minutes, the same as when other deep-draft vessels use the channel.
Transportation 4	Section 4.10.1.2 of the draft EIS did not address the Project's use of State Highway 42 or State Highway 38 from Interstate 5 for supply deliveries, the increase in traffic on state highways outside of the Coos Bay/North Bend area due to commuting workers, and associated impacts.	Section 4.10.1.2 of the EIS summarizes the findings of the Traffic Impact Analysis prepared by David Evans and Associates, Inc. (DEA 2017b) on behalf of Jordan Cove. As noted in section 4.10.1.2, the Project study area was established by the Oregon Department of Transportation, Coos County, and the City of North Bend and does not include the sections of State Highways 42 and 38 described in the comment summary. While not explicitly stated in DEA (2017b), it seems reasonable to assume that the Project study area established by the potentially affected state and local jurisdictions was selected to include those areas where potential impacts were expected to be greatest.
Transportation 5	Restrictions along the right-of-way could impact transportation. The cleared right-of-way could also serve as a barrier to wildlife movement.	The effects of the Project on transportation networks are addressed in section 4.10. Impacts on wildlife movements are addressed in sections 4.5 and 4.6.
Transportation 6	The EIS should address the likelihood that operations or accidents at the LNG facility could result in local bridge closures and the associated safety and economic impacts.	We do not anticipate circumstances where any local bridges would be closed during operations or accidents.
Transportation 7	The EIS should address the weather conditions and wave heights under which the pilot for Coos Bay will not allow transits, how frequently that occurs, and what the impacts are to the LNG tankers and the facilities.	The Coast Guard, Port, and pilots' decision regarding what conditions they feel would be safe to allow vessels to transit the navigation channel is not within the scope of this EIS or our authority, and that decision would be applied to all international shipping (i.e., it would not be a Project-specific decision applied differentially to different projects within Coos Bay). Section 1.3.9 of the EIS discusses the Coast Guard's roles and responsibilities, as well as their recommendations and determinations regarding the suitability and safety considerations related to LNG vessels in the bay.
Cultural		
Cultural 1	The draft EIS did not adequately disclose adverse impacts to Native American tribal interests and traditional territories including impacts to natural resources and disruption of traditional cultural practices, and fails to acknowledge that many impacts on sacred grounds cannot be mitigated. Project facilities should not be placed on tribal lands or disturb sacred sites. The draft EIS improperly dismissed impacts to trust resources of the tribes based on the lack of a ratified treaty; however, that is not the standard for assessment of gathering, hunting and fishing activities under NEPA.	The EIS discusses potential impacts on Indian tribes and natural resources traditionally utilized by tribes within their ancestral ceded lands, in many different places, including section 4.11, appendix L, section 4.9, section 4.4, and section 4.5. Only one traditional cultural property (TCP) was identified in the Project area, "Q'alay ta Kukwis schichdii me," encompassing the Coos Bay estuary, which is considered sacred to the Confederated Tribes of Coos, Lower Umpqua, and Siuslaw Indians (CTCLUSI). However, the draft EIS acknowledged that the ethnographic study is not yet complete. As stated in section 4.11.3.1 of the EIS, we recommend that the Commission Order contain an environmental condition requiring the applicants to produce a revised

TABLE R-2		
Comments on the Draft Environmental Impact Statement and Responses		
Comment Code	Comment Summary	Response
		ethnographic study. No project features are proposed for tribal lands (see section 4.11). The Project does not impact treaty rights.
Cultural 2	FERC must engage in strong government-to-government consultation with the tribal governments that will be affected by the construction of the Project.	We conducted government-to-government consultations with interested Indian tribes, as documented in section 4.11.1.2 and appendix L of the draft EIS.
Cultural 3	The applicants should be required to complete all cultural resources inventories consultations and site evaluations required for compliance with the National Historic Preservation Act. The draft EIS fails to indicate whether there is a clear plan for the Project to complete the evaluation of sites of possible historical significance and execute agreements with the tribes. Due to the lack of complete information, it's impossible to determine how this Project will impact cultural resources, whether those impacts can be avoided and whether or not those impacts will be mitigated.	Recommendation number 33 in section 5.2 of the draft EIS, if adopted by the Commission as a condition into the Project Order, would require the applicants to complete cultural resources investigations and site evaluations prior to construction. Further, in section 4.11.5, we explain that we would develop an agreement document, in consultations with the consulting parties, including interested Indian tribes, to resolve adverse effects at affected historic properties.
Cultural 4	The FERC should explicitly reference Jordan Cove's engagement with the tribes and how many times Jordan Cove has met with or offered meetings with tribal representatives in the EIS.	This information is presented in section 4.11 of the EIS.
Cultural 5	Currently proposed fish salvage measures would not adequately capture and protect lamprey, which is an important resource to tribal communities. The draft EIS recommends that the applicant develop a Fish Salvage Plan that specifically addresses lamprey; however, as a recommendation and not a requirement there is no assurance that this would be done.	The recommendations in the EIS are the FERC Environmental Staff's recommendations to the Commission on what measures should be included in an Order to further avoid, reduce, or mitigate impacts on the environment. Ultimately, it is the Commission's decision on whether or not to make staff's recommendations conditions of an Order.
Cultural 6	The EIS should consider a historical site for an old school building located near the pipeline route (no specific location provided).	Studies conducted to support federal permitting of the Project have addressed potential impact on historic structures that are within the defined Area of Potential Effect (APE) for the Project. If the old school building referenced in this comment is a historic structure and is within the APE, it has been included in the assessment of potential effects.
Cultural 7	Natural gas extraction to serve the Project comes from lands of the Shasta Nation; however, there is no agreement currently in place between the Shasta Nation and the applicants. FERC should meet with the Shasta Nation regarding the Project.	The Shasta Indian Nation is located in northern California and natural gas to serve the Jordan Cove Project would not be extracted from this area.
Cultural 8	The draft EIS failed to provide a completed ethnographic study; this study should be completed before the EIS.	As stated in section 4.11.3.1 of the EIS, we recommend that the Commission Order contain an environmental condition requiring the applicants to produce a revised ethnographic study prior to construction.
Cultural 9	The draft EIS analysis of cultural resources was inadequate because it did not consider the traditional cultural property proposed by the CTCLUSI currently under consideration by the National Park Service and potential impacts of the Project.	The TCP "Q'alay ta Kukwis schichdii me" was identified in the EIS as encompassing the Coos Bay estuary.
Air Quality and Climate Change		
Air Quality and Climate Change 1	General concern was expressed regarding the Project's contribution to climate change, including factors such as Oregon's ability to attain its greenhouse gas (GHG) goals, the role of escaped methane as a GHG, the contribution of Project activities such as tree clearing, and that the Project would become the largest emitter of greenhouse gases in the State.	We understand these concerns and have correctly identified the GHG emissions in sections 4.12 and 4.14 of the EIS. Although the State of Oregon has identified general goals, it has not specifically identified a framework or reductions by sector, fuel, etc., to obtain these reductions. However, we acknowledge that the Project's GHG emissions, without replacing higher carbon fuels such as coal or oil within the state, would not help reduce GHG within the state.
Air Quality and Climate Change 2	The EIS should address the upstream and downstream effects of natural gas extraction and export, including from burning gas in Asia, and their cumulative effects on GHG emissions, climate change and environmental resources. The EIS should consider the D.C. Circuit conclusions in <i>Sierra Club v. FERC</i> . Knowing the exact, individual end uses is not a necessary precondition to assessing reasonably foreseeable downstream emissions.	"Life-cycle" emissions from upstream and downstream sources are not regulated by FERC and are beyond the scope of this Project-specific analysis. The U.S. Court of Appeals for the D.C. Circuit (D.C. Circuit) has made clear that the DOE, rather than the Commission, has the responsibility to assess the indirect impacts of the GHG emissions of LNG exports as part of the DOE's determination of the public interest in exporting the natural gas. However, the Commission still has the clear responsibility to disclose and consider the direct and cumulative impacts of the proposed LNG export facility, and make significance determinations regarding such impacts, in order to satisfy our obligations under NEPA and Section 3 of the NGA. ² <i>Sierra Club v. FERC</i> , 827 F.3d 36, 47 (D.C. Cir. 2016) (Freeport)
Air Quality and Climate Change 3	The EIS should address incremental impacts of climate change and present the monetized social cost of carbon and GHG emissions using available modeling tools; the NEPA requirement to look at "environmental and related social and economic effects" must include impacts due to climate change. FERC should use the Interagency Working Group's 2016 estimates of the social cost of carbon as the metrics to measure the social cost of GHG. It is arbitrary for the draft EIS to monetize economic impacts (e.g., table 4.9.1.4-1) but not monetize environmental costs.	The Social Cost of Carbon tool, as well as the Social Cost of Methane and Nitrous Oxide tools, estimates the monetized climate change damage associated with an incremental increase in carbon dioxide (CO ₂) emissions in the given year. It estimates the cost today of future climate change damage, represented by a series of annual costs per metric ton of emissions discounted to present-day value. As indicated in 62 FERC ¶ 61,233, Order on Remand Reinstating Certificate and Abandonment Authorization for the Southeast Market Pipelines Project (SMP Order), we do not use monetized cost-benefit analyses as part of the NEPA review. The CEQ does not require agencies to conduct a monetary cost-benefit analysis for the NEPA review. Siting infrastructure involves making qualitative judgments between different resources as to which there is no agreed-upon quantitative value. As such, we do not conduct a monetary cost-benefit analysis in our NEPA review. The EIS did quantify some of the Project's direct socioeconomic benefits (e.g., employment and tax payments) in section 4.9 because those benefits occur in units of dollars and are directly comprehensible in units of dollars. However, because we lack quantified information about all of the costs and benefits (present and future) of the Project, the final EIS does not use the limited available quantified benefits in a cost-benefit analysis to inform our comparison of alternatives, choices of mitigation measures, or determination about the significance of the Project's environmental impacts.
Air Quality and Climate Change 4	The draft EIS does not address all of the effects of construction and operation of the LNG terminal and pipeline in light of risks	We identified certain impacts within section 4.14 of the final EIS. Climate change is wide ranging and has caused and will cause

² *Sierra Club v. FERC*, 827 F.3d 36, 47 (D.C. Cir. 2016) (Freeport) ("[T]he Commission's NEPA analysis did not have to address the indirect effects of the anticipated export of natural gas. That is because the Department of Energy, not the Commission, has the sole authority to license the export of any natural gas going through the Freeport facilities."). See also *Sierra Club v. FERC*, 827 F.3d 59 (D.C. Cir. 2016) (Sabine Pass); *EarthReports, Inc. v. FERC*, 823 F.3d 949 (D.C. Cir. 2016).

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
	associated with global climate change, i.e., increase in average annual temperatures, likelihood of extreme heat events, changes affecting water supply, availability, and quality, increased wildfire frequency and intensity, changes due to increased ocean temperatures, increased drought incidence, sea level rise and associated risks, population and distribution changes of plants and wildlife, susceptibility of ecosystems to diseases and invasive species, loss of wetlands and wetland services, increased extreme precipitation and flooding and increased incidence of landslides. The EIS should evaluate all environmental impacts and safety and security risks, including LNG facility and pipeline design, in the context of future climate conditions at the end of the Project lifespan (2070) as well as the current conditions.	greater systematic changes in the climate, vegetation, water, and species impacted by the Project. For a larger discussion of climate change, we encourage readers to look at the Fourth National Climate Assessment (https://www.globalchange.gov/), as well as various reports from the Intergovernmental Panel on Climate Change (https://www.ipcc.ch/). Many of the impacts of climate change that would increase risk to the Project facilities were evaluated, such as sea level rise's impact due to climate change on the LNG terminal, and much of our <i>Plan</i> and <i>Procedures</i> deal with mitigating sedimentation, and water management due to rain during construction.
Air Quality and Climate Change 5	The statement in the draft EIS section 4.14.1.10 that "Without the ability to determine discrete resource impacts, we are unable to determine the significance of the Project's contribution to climate change," contradicts information in that same section that direct emissions "would result in annual CO ₂ e emissions of about 2.14 million metric tons of CO ₂ e, which would represent 4.2 percent and 15.3 percent of Oregon's 2020 and 2050 GHG goals, respectively," which demonstrates the impact is significant. The EIS should assess the Project relative to the 2018 Intergovernmental Panel on Climate Change (IPCC) global warming goal and the steps needed to achieve it.	The IPCC does not set "goals." The IPCC reports lay out various scenarios, and indicate the estimated impacts for those, as well as mitigation required to obtain the scenarios. As indicated by the organization, " <i>IPCC reports are neutral, policy-relevant but not policy-prescriptive.</i> " As indicated previously, the United States' President has indicated that it is the policy of the United States to withdraw from the Paris Agreement of the United Nations Framework Convention on Climate Change.
Air Quality and Climate Change 6	The EIS should address health impacts from air emissions from the LNG terminal and proposed compressor station in Malin, Oregon, and should identify risks to medically vulnerable populations. FERC should require air monitoring stations near vulnerable populations during operation of the site and procedures for notification if elevated levels are detected. Local impacts, considering prevailing wind patterns, should be assessed.	The EIS has evaluated federal emissions standards which are established based on potential impact on human health. Additional information has been added to section 4.12 of the EIS. Additional mitigation for air quality beyond what is presented in the EIS would not be required by the FERC; however, the state may require additional measures as part of the state permitting process.
Air Quality and Climate Change 7	Presenting only the volume or rate of emissions in the EIS is inadequate to reflect actual impacts, because climate impacts are non-linear depending on the background concentration of greenhouse gasses and stresses to physical and economic systems. FERC should consider Project timing and address both present and future climate impacts for various alternatives in the context of background projections of greenhouse gases over time. Use of a 100-year Global Warming Potential is arbitrary; a 20-year basis is more justifiable.	As indicated the final EIS section 4.14.1.10, we cannot determine discrete climate change impacts. EPA indicates that the global warming potential (GWP) of methane is between 28–36, and nitrous oxide has a GWP between 265–298 over 100 years. We selected the IPCC's Fourth Assessment Report (AR4, 2007) GWP values for methane and nitrous oxide for the 100-year timescale because these are the values EPA established for reporting of GHG emissions, EPA's methane reduction voluntary programs, and the EPA's Inventory of U.S. Greenhouse Gas Emissions and Sinks. EPA acknowledged the Fifth Assessment Report could lead to more accurate assessments of climate impacts in the future. However, when balanced with the benefit of retaining consistency across agencies, national and international programs, the potential gain in accuracy does not justify the loss of consistency in reporting and likely would cause stakeholder confusion among the various GWPs used in different programs. EPA identified that it may consider adoption of the Fifth Assessment Report (AR5) GWPs in the future, at which time we will request the use of the revised GWP values for methane and nitrous oxide in future NEPA evaluations.
Air Quality and Climate Change 8	The risk from invasive species (including aquatic species via ballast water) needs to be assessed in the context of the additional stressors of global climate change, ocean acidification, and reduced dissolved oxygen making ecosystems more susceptible to invasion.	Invasive species are addressed in the EIS (see sections 4.3, 4.4, 4.5, and 4.6).
Air Quality and Climate Change 9	The draft EIS identified the carbon dioxide equivalent of methane as 25. That value is incorrect and outdated. Current values are 34 times on a 100-year basis or 86 times on a 20-year basis, as identified by the IPCC.	See response to Air Quality and Climate Change 7.
Air Quality and Climate Change 10	For all monitored air pollutants, the draft EIS claims that emissions are expected to fall below National Ambient Air Quality Standards (NAAQS), but there is no data to support or refute this. The closest monitoring sites for criterion air pollutants are in Eugene and Lane County, so the local air quality status is unknown.	As noted in the comment, the existing air quality concentrations presented in table 4.12.1.2-1 for the Jordan Cove LNG Project are from monitoring sites located some distance from the proposed Jordan Cove terminal. If anything, these concentrations are likely to be higher than the actual existing ambient concentrations in the vicinity of Coos Bay, since the selected monitoring sites are located in areas that are relatively more populous and urban. For the dispersion modeling analysis of the Jordan Cove emission sources, results of which are presented in table 4.12.1.3-3, ambient background concentrations were actually obtained from the Northwest AIRQUEST database maintained by Washington State University, which contains estimated ambient background concentrations for each cell in a 12 kilometer (km) by 12 km grid covering the states of Idaho, Oregon, and Washington. These ambient concentrations were estimated based on monitoring data and runs of EPA's CMAQ model. The values for the grid cell closest to the proposed Jordan Cove terminal were used in the dispersion modeling analysis that demonstrated compliance with the NAAQS standards.
Air Quality and Climate Change 11	There are no safe levels established for some of the hazardous air pollutants emitted by the LNG facility: n-hexane, benzene, formaldehyde, PAHs, arsenic, cadmium, and mercury. The EIS should address mercury emissions.	Comment noted. No mercury emissions would be expected during construction or operation of the Project.
Air Quality and Climate Change 12	The EIS should disclose odor-causing emissions during operations and associated impacts to residents, especially those located downwind of the LNG facility.	Emissions that would result from construction and operation of the Project (including those that would be identified as having an odor) are addressed in section 4.12 of the EIS. Note that the gas in the pipeline would not be odorized (unlike smaller distribution gas pipelines where the gas is odorized). The pretreatment facility uses an amine regeneration process that captures sulfur compounds and would remove about 98 percent of hydrogen sulfide and other sulfur compounds. When the sulfur removal units are fully saturated, they are removed and sent off site for disposal. The remaining acid gas stream (mostly CO ₂ with trace hydrogen sulfide and trace hydrocarbons) is incinerated in the thermal oxidizer. These processes may have minor odors associated with the oxidization and the removal of the sulfur compound from the site, but the impacts should be contained primarily onsite.
Noise		
Noise 1	The draft EIS should address the human health impacts of exposure to excessive levels of both intermittent and continuous noise. Compliance with regulations is not sufficient to ensure no negative health impacts occur. The EIS should acknowledge that noise increases due to the operational facilities are significant and additive to the community. Effects of noise levels on worker hearing should be addressed.	The EIS has been updated to address current literature as found in the World Health Organization publications. Also, see our side-by-side responses to Dr. Suter's comments below (IND291).

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
Noise 2	The noise assessment in the draft EIS does not define what period of time is considered temporary, or what criteria are being used for the determination of significance. If construction lasts several years, noise from pile driving and dredging operations over a several year period could be significant to residents.	Section 4.0 in the EIS defines time periods and what would be considered temporary versus permanent. The timing associated with construction of the Project as well as justification for our significance determination are also provided in section 4.12 of the EIS. Also, see our side-by-side responses to Dr. Suter's comments below (IND291).
Noise 3	The noise assessment should address the plan to add a runway to the airport and associated cumulative effects on noise. The draft EIS also failed to consider noise associated dredging, including maintenance, for the Coos Bay channel modifications.	Cumulative effects are addressed in section 4.14 of the EIS and include the proposed modifications to the runway.
Noise 4	FERC should require specific noise mitigation measures rather than allowing mitigation measures to be used "as necessary" or waiting for noise limits to be exceeded during construction or operation. The applicants would not have incentive to employ noise mitigation measures once construction has begun. There is too much lag between when elevated noise levels first occur and when mitigation measures would need to be employed.	Staff considered measures to avoid, reduce, and mitigate impacts on the environment resulting from construction and operation of the Project; and as appropriate, has made recommendations to the Commission.
Noise 5	Due to the use of a day-night average (L_{dn}) for operational noise from the LNG terminal at noise-sensitive areas (NSAs), the estimate of $<1-3 L_{dn}$ in the draft EIS may underrepresent nighttime noise and the significance of impacts at night. The existing ambient noise is primarily daytime traffic and it is much quieter at night, so the noise impacts would be more noticeable.	The noise descriptor " L_{dn} " takes into account the increased sensitivity to noise during the nighttime and incorporates a night penalty.
Noise 6	The draft EIS should address the increased noise levels from additional ship traffic of LNG carrier vessels and tug boats from a perspective of human perception, not just as a potential disturbance to marine mammals.	Existing ambient conditions in and around Coos Bay were considered in the draft EIS. Construction noise impacts associated with activities such as pile driving, dredging, vessel movements, and HDD were analyzed relative to Coos Bay and nearby onshore NSAs. For pile driving and HDD activities we have recommended noise mitigation measures as indicated in the draft EIS. During operation of the Jordan Cove LNG Project would be less than one ship movement per day. Noise from LNG carriers is not expected to create a noticeable change in overall noise levels. As noted in section 4.12.2.3 of the draft EIS, the reflective nature of water within Coos Bay was incorporated into the acoustic modeling analysis. Based on review of the North Bend City Code, it does not appear that there are any numerical decibel limits that would be applicable to the Project.
Noise 7	The draft EIS lacks estimates of construction noise levels at NSAs for the Klamath Compressor Station.	Construction of the Klamath Compressor Station would cause temporary increases in ambient noise levels in the immediate vicinity of the construction site. See section 4.12.2.4.
Noise 8	The evaluation of operational noise levels for the Klamath Compressor Station is inadequate because the final equipment design has not been determined and there is no clear commitment which mitigation measures will be used. The applicants should be required to implement the noise mitigation measures that are listed in the draft EIS as being available to reduce operational noise levels as part of the Klamath Compressor Station design.	Compressor station operations have been modeled and shown to have no significant impact at NSAs. In order to ensure the compressor station is compliant with our noise regulations, we are recommending that Jordan Cove should file a full power load noise survey with the Secretary for the LNG terminal no later than 60 days after each liquefaction train is placed into service. If the noise attributable to operation of the equipment at the LNG terminal exceeds an L_{dn} of 55 A-weighted decibels (dBA) at the nearest NSA, within 60 days Jordan Cove should modify operation of the liquefaction facilities or install additional noise controls until a noise level below an L_{dn} of 55 dBA at the NSA is achieved. Jordan Cove should confirm compliance with the above requirement by filing a second noise survey with the Secretary no later than 60 days after it installs the additional noise controls. For the purposes of the Project acoustic analysis, our 55 dBA L_{dn} noise criterion and other applicable noise regulations at the state, county, and/or local levels provide the framework for assessing Project compliance. Our noise criterion is derived from the 1974 EPA study titled "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety". The EPA determined that an L_{dn} of 55 dBA protects the public from indoor and outdoor activity interference. An L_{dn} of 55 dBA is equivalent to a continuous noise level of 48.6 dBA, which, when compared to examples of typical everyday sound sources given in table 4.12.2-1, equates to a sound experienced in a quiet rural residential room and is generally lower than sound levels during a normal conversation.
Noise 9	The EIS should include an analysis of the number of residences and other NSAs that would be affected by blasting activities.	Over 100 structures are within 150 feet of the pipeline right-of-way or TEWAs, and several residences are within 50 feet of the pipeline construction right-of-way or TEWAs. As described in the EIS, blasting impacts are localized and measures would be implemented to reduce and minimize any resulting impacts.
Noise 10	The draft EIS presents noise from intermittent or infrequent events such as pile driving, rock blasting, venting and blowdowns as an L_{dn} , which is inappropriate to convey the disruptive nature of loud, brief events. Maximum noise levels should be used for these activities.	With the exception of rock blasting, maximum sound levels (L_{max}) were reported. As the blasting plan is further developed, expected L_{max} values and potential noise impacts at NSAs will be reevaluated
Noise 11	The EIS needs to address the impacts of operational noise from the LNG facility, vessel traffic and pipeline construction on wildlife, including wildlife in adjacent terrestrial habitats.	Impacts of noise on wildlife are addressed in sections 4.5 and 4.6 of the EIS, as well as in our BA.
Noise 12	The noise assessment did not adequately consider topography around North Bend. This resulted in the designation of NSAs that are actually more shielded than other locations. The assessment should also have considered the effects of multiple noise sources operating at the same time during construction or operation of the facilities.	The NSAs evaluated in the EIS were identified based on distance from potential Project noise sources. The estimates of sound at each NSA did account for topography as is apparent in the sound contour results provided in appendix M. Other factors that would shield sound such as vegetation and buildings were conservatively ignored. The estimates of sound during construction and operation also accounted for multiple noise sources operating at the same time.
Reliability and Safety		
Reliability and Safety 1	Dredged soils cannot be safely used to raise the elevation at the LNG Terminal and Kentuck project site (as currently proposed). These elevated foundations and deposited soils would erode or fail, resulting in unsafe conditions at the facility. Piles driven into sandy soil will not be sufficient to support the facility on the North Spit without sinking.	Comment noted.
Reliability and Safety 2	The applicants should be required to design the Project beyond the safety standards outlined in the USDOT pipeline standards as published in 49 CFR Parts 190-199; Part 192 of 49 CFR. Specifically, design the pipeline thickness to be more than what is required by the USDOT for the affected areas. The EIS needs to analyze the impact relative to cost of lower safety standards in Class 1 areas, even if these standards are set by another agency. The EIS should be consider the proposed maximum operating pressure of	It is outside our jurisdiction to make these requirements. As disclosed in section 4.13 of the EIS, the pipeline would be designed per the safety standards outlined in the USDOT pipeline standards as published in 49 CFR Parts 190-199; Part 192 of 49 CFR. Your disagreement with the USDOT's federal safety standards is noted.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
	<p>the pipeline as 1,950 pounds per square inch gauge (psig), because the applicants have indicated the pressure might be increased to 1,950 psig in the future. FERC should include a condition that the pipeline design and installation be subject to a third-party review by Oregon professional engineers hired by the state of Oregon Department of Transportation. Design and installation shall be performed to state-of-the-art standards of the industry to ensure that the pipeline can be operated safely and will not have adverse impacts on public safety, the environment or existing public infrastructure.</p>	
<p>Reliability and Safety 3</p>	<p>Jordan Cove is not suitable for siting an LNG terminal or the transport of LNG, based on recommendations of the Society of International Gas Tanker and Terminal Operators (SIGTTO). The EIS should address the following deviations of the Jordan Cove from the SIGTTO recommendations:</p> <ul style="list-style-type: none"> a) The facility is sited too close to population centers, relative to recommendations to maintain a 2.2-mile distance between an export port and the local population; b) The Jordan Cove area is actively used by vessels and recreational boating, despite SIGTTO recommendations that LNG terminals be sited remote from other port users; c) Having two berths at the proposed mooring slip is against recommendations to keep other vessels away from LNG carriers due to collision risk; d) LNG terminals should not be located on the outside bend of a shipping channel, to reduce vessel collision risk, however, the Jordan Cove terminal is on the north side of a bend in the Coos Bay shipping channel; e) LNG tankers should have an emergency escape immediately available, however, the loaded LNG tankers can only move in the channel during limited times at high tides. Comments cited carrier transit times of 1-2 hours, compared to a tsunami warning time frame of about 10 minutes; f) The Coos Bay shipping channel is not sufficient width to meet SIGTTO recommendations, including recommendations that the channel be five times the width and that turning radiuses be twice the overall length of the largest vessels, for maneuvering; g) The Coos Bay shipping channel does not meet minimum depth recommendations; and h) Long in-shore channels for LNG carrier traffic should be avoided. 	<p>The siting, design, construction, and operating requirements for the Project are contained in 18 CFR 153, 18 CFR 380, 33 CFR 103 through 105, 33 CFR 127, and 49 CFR 193. These regulations do not require the use of SIGTTO publications. FERC regulations under 18 CFR 380 require an applicant identify all codes and standards under which the plant (and marine terminal, if applicable) will be designed, and any special considerations or safety provisions that were applied to the design of plant components. The applicant did identify SIGTTO Information Paper No. 14 as one of the standards. SIGTTO Information Paper No. 14, Site Selection and Design for LNG Ports and Jetties, states "The recommended site selection process removes as many risks as possible by placing terminals in sheltered locations remote from other port users." and "...all direct port designers to construct jetties handling hazardous cargoes in remote areas where other ships pose a collision risk and where any gas escape cannot affect local populations." in section 6.2, and "...find a location suitably distant from centres of population" in section 7.2.5. However, it also states "Some [criteria for site selection], such as the proximity of the plant to centres of population, lie beyond the pure marine interest and outside the main scope of this paper." in section 5, and offer no criteria for what constitutes suitably distant from population centers or which scenarios for gas escape cannot affect local populations. Moreover, most of the discussion in the SIGTTO Information Paper No. 14 provides general statements on risk reduction and does not establish requirements. However, SIGTTO Information Paper No. 14 does make reference to a number of risk reduction measures (i.e., strength/positions of mooring systems and breasting dolphins; interlinking of ship and shore ESD systems; installing quick acting valves at the PERC connections; using sensors to monitor the positions of the LNG loading arms; limiting ignition sources on the jetty; use of tugs and pilots to safely maneuver the LNG marine vessel to the jetty, etc.) are either required by regulation or are considered during the Coast Guard and FERC's evaluation of the project. Jordan Cove also provided simulations of the LNG marine vessel in various adverse scenarios to demonstrate it can safely transit and dock at the LNG facilities. In addition, as indicated in section 4.13.1.3 of the final EIS, Coast Guard issued a Letter of Recommendation indicating the waterway is suitable for the type and frequency of marine traffic; in section 4.13.1.2 of the final EIS, USDOT PHMSA issued a Letter of Determination on its siting regulations for the LNG facilities; and in section 4.13.1.5 of the final EIS (FERC Preliminary Engineering Review), FERC conducted an engineering review on the use of various layers of protection or safeguards to reduce risks of potential hazards to offsite public. FERC also reviewed potential impacts from natural hazards and external impacts from the surrounding areas.</p>
<p>Reliability and Safety 4</p>	<p>The EIS should disclose the records of past safety violations that have occurred on similar projects industry wide, as well as those specific to the applicants' past projects. The EIS should list the nature of each individual violation, how often and prevalent these violations were, the consequences of these violations (e.g., fines or disciplinary actions), and the remedial actions taken to address each individual violation.</p>	<p>Section 4.13 of the EIS describes and assesses reliability and safety of the Project as proposed. It is not necessary for the EIS to evaluate past safety violations either by the industry or the applicants.</p>
<p>Reliability and Safety 5</p>	<p>The draft EIS condition that "prior to initial site preparation, Jordan Cove should file with the Secretary documentation demonstrating it has received a determination of no hazard (with or without conditions) by USDOT FAA for all permanent structures, temporary construction equipment, and mobile objects that exceed the height requirements in 14 CFR 77.9. (draft EIS 4-755) In addition, FERC staff recommended Prior to initial site preparation, Jordan Cove shall file with the Secretary documentation demonstrating it has received a determination of no hazard (with or without conditions) by USDOT FAA for all permanent structures, temporary construction equipment, and mobile objects that exceed the height requirements in 14 CFR 77.9. (section 4.13.1.6)" does not go far enough, and the final EIS should not be produced until the FAA has made its final determination and all FAA requirements are met.</p>	<p>Comment noted.</p>
<p>Reliability and Safety 6</p>	<p>The draft EIS underestimates the risks and consequences of leaks from the LNG facility or tankers and potential impacts within the mapped Hazard Zones. The EIS should consider the consequences of cascading impacts from multiple failure points, not just a single-spill scenario. Assessment should consider the prevailing winds and oxygen delivery; wind tunnel and flood and ebb tide studies should be conducted for various accident scenarios. Construction of emergency bunkers or shelters for residential neighborhoods in the Hazard Zones should be required. An emergency response and evacuation plan is needed for earthquake and/or tsunami events affecting the LNG terminal, addressing the bay, bridges, and the airport. This should include assessment of any conflicts with the US Navy's response plans to provide supplies to the area in the case of an emergency.</p>	<p>The USDOT PHMSA siting requirements often necessitate the evaluation of multiple release scenarios. Section 4.13.1.5 of the FEIS (Spacing and Layout) discusses how process releases would be mitigated through fire protection measures to prevent cascading damage onsite. Mitigation measures such as spill containment systems, cryogenic protection on structural components, fireproofing, etc. are summarized under Hazard Mitigation Design section of the FEIS and would be present regardless of the frequency of a release scenario. These mitigation measures would be present for both single-spill scenarios as well as for multiple point failures. For LNG marine vessel operations, the Zones of Concern are based on Sandia Reports published in 2004 and updated in 2008 and 2012. These reports indicate that any LNG marine vessel event (i.e., single cargo tank breach or multiple point breaches) would likely ignite the resulting release and create a pool fire. In the event of a large release of LNG that ignited, the extent of impacts to the public would depend on the location of the release and subsequent fire (and would not impact the entire population of Coos Bay and North Bend). The impacts within the Zones of Concern are further discussed in Section 4.13.1.3 of the FEIS and are based on the larger hazard distances from intentional acts (i.e., terrorist acts) and are also based on the cascading damage to the LNG marine vessels per the Sandia Reports. In addition, Coast Guard evaluated the Zones of Concern and safety and security measures and other recommendations proposed in the Waterway Suitability Assessment and recognized the implementation of them in their Letter of Recommendation in their determination that the waterway is suitable for the type and frequency of the proposed LNG marine vessel traffic.</p>
<p>Reliability and Safety 7</p>	<p>The use of vapor barriers around the Project site increases the risk of vapor cloud explosion by preventing vapor dispersal.</p>	<p>Section 4.13.1.2 of the final EIS discusses USDOT PHMSA's Letter of Determination on compliance with the siting regulations of 49 CFR 193. This determination considers vapor dispersion and vapor cloud explosions scenarios that utilized USDOT PHMSA approved hazard models. These hazard models considered the locations and heights of vapor barriers as well as obstructions created by the proposed equipment in the vapor cloud explosion analysis. We also note that vapor barriers are commonly used</p>

TABLE R-2		
Comments on the Draft Environmental Impact Statement and Responses		
Comment Code	Comment Summary	Response
		as mitigation at LNG facilities.
Reliability and Safety 8	The EIS should include additional analysis of wildfire risks, including evaluation of the possibility that a forest fire in the affected area could ignite the gas within the subterranean pipeline or from a leak, resulting in an explosion; impacts of fire to block valve sites; allowing construction during summer months when fire risk is highest; increased human use of the right-of-way and access roads; fire suppression; increased drying and fuel-buildup along the cleared pipeline right-of-way; longer expected fire seasons due to climate change; emergency response; dependence on volunteer fire departments along the pipeline route; limitations on firefighting caused by the pipeline and access; and what resources, equipment, and training would be provided by the applicants to assist firefighting. The EIS should include a wildfire mitigation plan.	Section 4.13.2.1 of the EIS includes a thorough discussion of pipeline standards to reduce fire risk to forest lands, as well as Project-specific measures that Pacific Connector would implement to reduce the risk of wildfire from construction and operation of the pipeline and respond to wildfires near the pipeline.
Reliability and Safety 9	The engineering design and the heights of the structural barriers for the LNG facility as presented in the draft EIS are inadequate to address earthquake and tsunami risk. The draft EIS does not address the effectiveness of the protective berm for the facility to protect against a tsunami in the context of rising sea level due to climate change or the potential for ground lowering due to subduction. The draft EIS did not include detailed LNG terminal design and therefore does not have sufficient information to conclude the facility has adequate safeguards and protections, considering tsunami wave heights and inundation elevations. It is not possible to construct a berm that is an adequate size and strength or design the facility to withstand an earthquake and tsunami.	The proposed Project would not change the natural behavior of tsunamis. In addition, The US Coast Guard issued a Letter of Recommendation on May 10, 2018 stating that Project would be considered suitable for accommodating the type and frequency of LNG marine traffic associated with this Project. The probability of tsunami as well the design resilience against an approximate 2,500-year earthquake and tsunami event is described in Section 4.13.1.5 of the FEIS, which meets or exceeds regulatory requirements and recommended and generally accepted good engineering practices, such as ASCE 7. In addition, a tsunami study was performed and stamped and sealed by a licensed professional engineer and included as a public document in the application, under Resource Report 13 Appendix I. The FEIS also describes relative sea level rise.
Reliability and Safety 10	The draft EIS does not address the risk to the LNG terminal or LNG tankers from air operations.	See our updated analysis in section 4.10 and 4.13 of the final EIS related to the FAA assessment, and the Project's potential impacts to the Southwest Regional Airport.
Reliability and Safety 11	The EIS needs to assess the thermal plume hazard to aircraft from the gas combustion turbines at the liquefaction facility.	Thermal plumes and the effects that they could have to air traffic are addressed in sections 4.10 and 4.13 of the EIS.
Reliability and Safety 12	The risk of a tsunami strike on an LNG carrier, either during loading or while in transit, is not adequately addressed and the EIS should provide the estimated warning times for a tsunami from an earthquake originating in the CSZ, relative to the amount of time required for emergency response actions to secure LNG carrier vessels.	The Coast Guard evaluated the suitability of the waterway and based on their expertise and evaluation of the Waterway Suitability Assessment and other factors issued a Letter of Recommendation indicating the waterway would be suitable for the type and frequency of the proposed LNG marine vessel traffic. While LNG marine vessels are in transit, it is anticipated that any effects from a tsunami event would be similar to effects on other sea faring vessels such as cargo carriers, oil tankers, cruise ships, etc. However, these other sea faring vessels typically do not consist of double hull design present in LNG marine vessels. For LNG marine vessels docked at the facility, the Project would install powered emergency release coupling (PERC) valves on each LNG marine vessel loading arm connection. In the event a tsunami event causes a breakaway of an LNG marine vessel, the PERC valves on each marine arm would instantaneously activate and isolate the LNG flow with minimal release of LNG. For reference, see the Golar Freeze incident in the LNG Marine Vessel Historical Record Section of the FEIS. In addition, a tsunami study was performed and stamped and sealed by a licensed professional engineer and included as a public document in the application, under Resource Report 13 Appendix I. Furthermore, FERC staff recommend the submittal of an Emergency Response Plan in coordination with local, state, and other federal agencies in accordance with Energy Policy Act of 2005 and would typically cover response to natural hazards.
Reliability and Safety 13	The draft EIS does not adequately address the risk of unconfined vapor cloud explosion from heavier hydrocarbons at the Jordan Cove Terminal. Specifically, FERC environmental staff were asked to address the following comments on the analysis: a) the draft EIS did not include detailed predictions of vapor cloud explosion overpressure for design spills of heavy hydrocarbons; b) the Facility Siting Hazard Analysis filed by the applicants in their Siting Review Package (supplemental filing dated November 16, 2018) used the FLACS model to calculate hazard footprints for overpressures, but: i. the FLACS mathematical model is not conservative enough and underpredicts possible overpressures compared to measurements from real incident data; and ii. the FLACS model was approved by the PHMSA for prediction of vapor dispersion, but it has not been formally evaluated or approved by PHMSA for the purpose of explosion overpressure prediction, and a written protocol has not been developed; c) requirements of 49 CFR 193 relating to unconfined vapor cloud explosion are based on outdated regulations and assumptions designed for LNG import terminals that are not appropriate for LNG export terminals, and the regulations have not yet been updated by PHMSA to consider LNG export operations. Therefore, the EIS should provide additional assessment and evaluation of unconfined vapor cloud explosion hazard; d) The EIS should consider results and conclusions of the PHMSA-sponsored report entitled <i>Review of Vapor Cloud Explosion Incidents</i> (Atkinson and Hall 2016) in the assessment of unconfined vapor cloud explosion hazard; e) Inadequate assessment of unconfined vapor cloud explosion hazard presents a public safety risk that has not been characterized; and f) the Memorandum of Understanding between FERC and PHMSA requires that PHMSA review applications for LNG projects to determine if the proposed facilities comply with the safety standards in PHMSA's regulations, and to issue its findings in a letter of determination to FERC. The letter of determination findings were not included in the draft EIS and should be provided by the time the final EIS is completed. Proprietary hazard modeling has not been subject to adequate validation or public inspection.	See response to comment IND2 in the side-by-side responses below.
Reliability and Safety 14	The EIS should clarify who is financially responsible for pipeline safety inspections and mitigation, and if it would be the applicants or the state or federal government.	The applicants are responsible for pipeline safety inspections and mitigation.
Reliability and Safety 15	FERC should change the following statement in the Executive Summary of the draft EIS: "Following construction, the primary impact of the Project would be the visible nature of the permanent pipeline easement. The visual impact of the easement would be similar to	Comment noted.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
	that of other utilities and roadways in the region." Impacts to safety and the risk of a catastrophic event should be considered the primary impact.	
Reliability and Safety 16	Monitoring of the LNG terminal storage tanks with seismometers as described in the draft EIS is not effective mitigation for earthquake risk; the seismometer alarm will not provide adequate warning to shut down operations in the event of a major earthquake. Moreover, a shutdown does not reduce public safety risk because LNG is still present and subject to potential leakage. It is not possible to safely shut down the facility. The containment structure for the tanks only provide for the volume of one tank, not two.	As addressed in Section 4.13.1.5 (Geotechnical and Structural Design), the LNG tank is designed to have the ability to safely withstand and shutdown when subjected to earthquake ground motions which have a 2 percent probability of being exceeded in 50 years (2,475 year mean return interval). In addition, each LNG storage tank has a concrete outer tank designed to hold over 110 percent of inner tank volume have the same ability to withstand a 2,475 year event, which is the current regulatory requirement. FERC staff recommend that the applicant provide the design calculations prior to construction of final design. The ground motions at the facility would be monitored by three sets of seismometers that act as an alert system to measure seismic waves. If a seismometer exceeds safe limits, an alarm would sound in the control room where operators would initiate safe shut down of the facility. The safe limits and response would typically be evaluated as part of the Emergency Response Plan in accordance with NBSIR 84-2833 as referenced in FERC regulations under 18 CFR 153 and 18 CFR 380.
Reliability and Safety 17	The EIS should clarify that the Project has been designed for seismic ground motions in accordance with NFPA 59A (2001) Chapter 6, which is included by reference in USDOT regulations 49 CFR 193.2101 Subpart C.	The USDOT regulations as codified in 49 CFR 193 are currently addressed in section 4.13 of the EIS.
Reliability and Safety 18	The draft EIS does not provide assurance that the terminal site is designed to withstand seismic shearing, and it is impossible to determine until an event occurs.	A seismic study was performed by a geotechnical company and certified by a licensed professional engineer. FERC staff evaluated this study, which considered seismic motions, time history for seismic design, peak ground accelerations, and a site response analysis in accordance with ASCE 7. FERC staff summarized this evaluation in Section 4.13.1.5 of the FEIS (Earthquakes, Tsunamis, and Seiche).
Reliability and Safety 19	The EIS should provide detailed review of methods of soil improvement to address liquefiable soils, which would be applied for the Project, and final site investigation results. This information should not be deferred until after an EIS is issued.	Section 4.1.2.3 addresses specific areas of liquefaction concern for the pipeline as well as mitigation measures for these areas, while section 4.13 addresses these concerns for the LNG facility. It is noted that there is a specification for areas of the pipeline that transition from rock to soil to be... "constructed with special backfill placed around the pipeline in areas where the pipeline transitions from rock to soil to alleviate potential stress resulting from differential movement in accordance with the pipeline operator's design basis specifications. For the pipeline segments that transition from the alluvial soils to rock, the special backfill would extend approximately 40 feet into the rock from the soil/rock interface."
Reliability and Safety 20	The EIS should include a description of how pipeline corrosion and weld or material failures would be identified and repaired for pipeline segments installed via HDD, such as under the Coos Bay Estuary. If repair or replacement is not possible, the EIS should describe how defective pipe segments would be bypassed.	During construction, the pipe would be tested using the standard methods described in section 2.0, for example, using smart tools and hydrostatic testing. If defects were encountered, the pipe would need to be reinstalled or corrected to meet safety standards. If corrosion, weld, or material failures are identified during operations, the applicants would be required correct the issue in accordance with USDOT requirements and seek any applicable federal and state authorizations for the required repair activity. The nature of the required repair would be dependent on the specific finding and would not be addressed in this EIS.
Reliability and Safety 21	The U.S. Coast Guard is "spread too thin" to adequately regulate vessels bound for a foreign country or to support actions the public perceives as benefiting foreign interests. Coast Guard procedures are inadequate to address potential hazards.	Comment noted.
Reliability and Safety 22	The pipeline should be designed with a cradle, and it should have a spill response plan and scheduled inspections. The EIS should also evaluate and require other design measures in environmentally sensitive areas to avoid or minimize impacts, including placing the line aboveground to reduce impacts to hydrology and assist with maintenance. Additional measures for the pipeline in environmentally sensitive areas should include shock isolation, fencing to prevent third-party impact, and a warning system for residents in the case of line failure.	We assume that reference to a cradle and spill response plan implies the commenter believes the pipeline would be installed aboveground and would transport liquids. As explained in the EIS, the proposed pipeline would transport natural gas and would be buried underground; therefore, a cradle and spill response plan would be inappropriate. The pipeline would be designed, constructed, and maintained in accordance with DOT PHMSA specifications that are specific to high pressure natural gas transmission pipelines. See discussion of pipeline design and safety standards in section 4.13.2 of the EIS. Placing the line aboveground would increase risks and is deemed to not be environmentally preferable.
Reliability and Safety 23	By not restricting and/or enforcing an LNG safety and security zone around LNG tanker vessels, Coos Bay residents are being placed at risk.	See section 4.10 for a discussion of the safety and security zone around LNG tanker vessels.
Cumulative Impacts		
Cumulative Impacts 1	If the Pacific Connector pipeline is routed through private lands, this may ultimately constitute a "disturbed right-of-way" that other linear projects may follow in the future, thereby magnifying the impact that would occur to affected property owners over time. Alternately, the applicants or a future company may use the pipeline easements acquired (whether granted or through eminent domain) for transportation of natural gas liquids (NGPL) or another completely different product or project.	Comment noted. However, it would be speculative to attempt to evaluate in the EIS the impacts from some possible, but unknown and undefined, future linear project that might be adjacent to the proposed pipeline.
Cumulative Impacts 2	The EIS should consider the effects of historic actions on Coos Bay and the health of this ecosystem in the cumulative effects analysis.	Past, present, and reasonably foreseeable actions are included in the cumulative effects analysis, as required by NEPA. Concerning these past (i.e., "historic") activities, the CEQ issued an interpretive memorandum on June 24, 2005, regarding analysis of past actions, which stated: "agencies can conduct an adequate cumulative effects analysis by focusing on the current aggregate effects of past actions without delving into the historical details of individual past actions." To understand the contribution of past actions to the cumulative effects of the proposed action, the analysis in the EIS relies on current environmental conditions as a proxy for the effects of past actions. Existing conditions reflect the aggregate effects of all prior human actions and natural events that have affected the environment and might contribute to cumulative effects. In this analysis, we generally considered the effects of past projects as part of the affected environment (environmental baseline).
Cumulative Impacts 3	On page 4-806 the draft EIS states: "It should be noted that while the impacts described above taken individually may be manageable for certain communities, the impacts of compound extreme events (such as simultaneous heat and drought, wildfires associated with hot and dry conditions, or flooding associated with high precipitation on top of saturated soils) can be greater than the sum of the parts (USGCRP 2018)." This is not adequate to fully disclose the nature of compound risks, and they should be more fully addressed in the EIS.	The text quoted in this comment is not Project-specific but is from a general study of climate change that is cited in the draft EIS as background for the Project-specific analysis. It is not the role of the Project EIS to address the general risks of climate change. The respective text has been modified in the final EIS.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
Cumulative Impacts 4	The draft EIS did not adequately address adverse impacts to endangered species (e.g., spotted owl, marbled murrelet, salmon) from Project construction in the context of existing anthropogenic stresses due to logging, other development and the effects of global climate change. This includes cumulative impacts to Coho salmon in the headwaters of the North and South Fork Little Butte Creeks.	Impacts to listed species are addressed in section 4.6 of the EIS as well as our BA provided to the Services. The Services will determine if we have sufficiently addressed and disclosed impacts to ESA-listed species.
Cumulative Impacts 5	The draft EIS cumulative impacts analysis is inadequate because it does not demonstrate how BMPs, the applicants' proposed mitigation measures, and FERC's recommended conditions will be sufficient to address cumulative impacts. The EIS should include an independent analysis of cumulative effects of the proposed actions, in addition to analysis provided by the applicants and cooperating agencies. The cumulative impacts analysis should not just consider the proposed alternative but should also consider whether the cumulative impacts of other alternatives are greater or less than the proposed alternative.	The EIS includes an independent analysis of cumulative impacts. As defined by the Council on Environmental Quality (CEQ), a cumulative effect is an impact on the environment that results from adding the incremental impacts of the Project with the impacts of other past, present, and reasonably foreseeable future actions. There is no requirement that each alternative considered must also be considered with past, present, and reasonably foreseeable actions.
Cumulative Impacts 6	The draft EIS cumulative impacts analysis does not reference plans by the Port of Coos Bay to construct a general purpose cargo terminal on the North Spit of the Coos Bay Estuary downstream of the proposed LNG terminal and carrier berth. This new cargo terminal should be addressed and added to the list of projects with potential cumulative impacts. The draft EIS should particularly consider cumulative effects relative to carrier traffic and vessel traffic.	In the late 2000s, the Port of Coos Bay contemplated construction of a general purpose cargo terminal on the North Spit of Coos Bay, known as the Oregon Gateway Project. However, it is our understanding that the Port of Coos Bay is no longer contemplating this project; therefore, it is not included as a reasonably foreseeable project in the cumulative effects analysis.
Cumulative Impacts 7	The draft EIS includes separate analysis of impacts to federal lands provided by the Forest Service and Bureau of Land Management; however, it is FERC's responsibility in the EIS to provide a cumulative analysis that includes aggregated impacts on all lands, including those under both federal and non-federal management.	The EIS includes an analysis of Project impacts on all lands, including private lands. The separate analysis of impacts on federal lands is also included in the EIS to support evaluation of amendments to specific land management plans on federal lands.
Cumulative Impacts 8	The method used to assess watershed-level cumulative impacts in section 4.14.1, by looking at the percentage of the watershed impacted by the proposed Project, is not meaningful because it ignores the uneven distribution of local sensitive environmental features within the watershed and the linear nature of the proposed facility.	We acknowledge that some resources are unevenly distributed within watersheds; however, the percentage of watershed affected is meaningful and provides context for assessing impacts.
Cumulative Impacts 9	The draft EIS did not identify the geographic range over which air quality impacts and GHGs are considered.	The geographic scope for cumulative impacts including the geographic scope for air quality impacts is identified table 4.14-1.
Cumulative Impacts 10	There is no acceptable cumulative effects analysis in the draft EIS for listed species under the ESA, impacts to state waters and waters of the U.S., impacts to the atmosphere, and impacts to soils. Cumulative effects should look beyond the 40-year timespan of the Project.	Comment noted. Cumulative effects on listed species, waterbodies, wetlands, and soils are included section 4.14.
Cumulative Impacts 11	Cumulative impacts to air quality should consider the cumulative effects of toxic pollution from wildfires which are recurring in the region.	Section 4.14 of the EIS acknowledges reasonably foreseeable cumulative impacts from periodic wildfires in the region, to the extent possible; however, because the specific future locations, scope, and occurrences of wildfires are unknown and unpredictable, a quantitative assessment of the cumulative air emissions is speculative and not meaningful.
Cumulative Impacts 12	The EIS should address the cumulative impact of multiple pipeline projects crossing the Klamath River, including past water quality impacts and fish kills that have occurred.	The cumulative effects assessment (section 4.14) addresses the cumulative effects of past, present and reasonably foreseeable actions. Existing water quality and past discrete events are considered part of the baseline conditions.
Conclusions and Recommendations		
Conclusions and Recommendations 1	The Project's proposed mitigation, including the Kentuck project and Eelgrass Mitigation site and the measures required by the various applicable agencies, are not sufficient to avoid, minimize, or compensate for the Project's impacts. Specifically, the mitigation proposals have the following issues: a wetland mitigation site in Coos County is not adequate to mitigate for freshwater wetlands in Klamath, Jackson and Douglas Counties; wetlands should be mitigated within the same watershed; inadequate wetland mitigation site design (e.g., does not account for sea level rise, incorrect proposed contours); sand/fill is not necessary for wetland mitigation; insufficient metrics for evaluating mitigation site success; and lack of consideration of the existing site conditions. Permanent impacts to eelgrass habitat are unacceptable. The EIS should consider factors that led to failure of an eelgrass mitigation project in Humboldt Bay. As the lead federal agency, FERC has the responsibility for the proper delivery by other cooperating agencies of environmental analysis and related mitigation.	The applicants would be required to adhere to standard BMPs, as well as applicable federal requirements in regards to avoidance/minimization/mitigation. If the Project is approved, the approval would be conditional on the applicants receiving all federal or federally designated authorizations. This would include authorizations and approvals from agencies with jurisdiction over regulated and compensatory mitigation (e.g., the COE has authority over wetland mitigation; the FWS and NMFS have authority over mitigation for ESA listed species, marine mammals, and migratory birds; the FAA, Coast Guard, as well as the USDOT have authority over some mitigation actions related to safety and reliability). We rely on the authority, expertise, and jurisdiction of these agencies regarding issuance of permits, related mitigation requirements, and the management of resources these agencies have jurisdiction over.
Conclusions and Recommendations 2	The impact assessment in the draft EIS relies too much on success of the proposed wetland mitigation sites, given the limited success of compensatory mitigation projects in general and lack of design details.	See response to Conclusions and Recommendations comment 1.
Conclusions and Recommendations 3	Given the estimated potential ground subsidence stated in the draft EIS, it is impossible to mitigate for the potential impacts of ground subsidence on the LNG facility.	Comment noted.
Conclusions and Recommendations 4	Where temporary impacts are expected, the EIS should consistently provide estimates of the time to recovery from impacts (including streams, rivers, estuarine/marine environments and forested lands).	See section 4.0, page numbers 4-1 through 4-2 of the EIS for a discussion of the timing of temporary impacts.
BLM/Forest Service Topics		
BLM/Forest Service Topics 1	The Draft EIS fails to disclose and examine the economic impacts to the O&C Counties.	The O&C Act management direction specifies sustained-yield forest production as the dominant use. Other uses are recognized by the Act and the applicable BLM Resource Management Plans. Specifically, there is direction to "Provide needed rights-of-way, permits, leases, and easements of BLM-administered lands in a manner that is consistent with Federal and State Laws. See <i>Southwestern Oregon Record of Decision and Resource Management Plan</i> (2016), page 93 and <i>Northwestern and Coastal Oregon Record of Decision and Resource Management Plan</i> (2016), page 80. If constructed, the area of the right-of-way would be maintained in low growing herbaceous cover and would be unavailable for timber production. Revenue collected in association with the initial right-of-way clearing and ongoing right-of-way rental fees would be shared with local counties in accordance with existing law and regulation. For pipeline safety, activities, including blasting and timber harvest operations may be restricted. The exact locations of future restrictions is unknown, however, these potential effects are properly disclosed in the EIS (see section 4.13).
BLM/Forest Service Topics 2	The Forest Service must consider a route to avoid NFS lands and not because the permit affords the applicant a lower cost or less	The FSM does not apply to this project because the BLM is the permitting agency to authorize the Right-of-Way Grant.

TABLE R-2

Comments on the Draft Environmental Impact Statement and Responses

Comment Code	Comment Summary	Response
	restrictive location when compared to non-NFS lands. See FSM 2703.2. DEIS fails to consider a no NFS lands alternative.	Implementing regulations of the BLM at 43 CFR 2800 or 2880 apply to the SF-299 application submitted by the applicant, Jordan Cove. In addition, section 3.4.1.3 of the draft EIS discloses that a non-FS route was considered but was not feasible given the extensive Forest Service lands north, west, and south, and of Malin, OR.
BLM/Forest Service Topics 3	BLM should not give a foreign corporation a reserve of their own, enabling clearcutting of our wildlife and stream-side reserves.	See response to CO 30-10
BLM/Forest Service Topics 4	The DEIS (2-23) explains that in the Pacific Connector Reserve “the BLM would maintain the values and resources necessary for... the proposed Project.” The DEIS failed to explain what specific “values” the pipeline has that the BLM must protect.	See response to CO 28-264
BLM/Forest Service Topics 5	The BLM can accept offered mitigation, but Pacific Connector has NOT offered any, at least not that the public knows about or in time for the only comment opportunity the public has. If the company were to offer mitigation in the future, then a new “reserve” should not be necessary. The BLM should just have their forest plan violations mitigated, like the Forest Service is doing.	The proposed project design features are designed to avoid or reduce impacts or restore conditions on all federal lands and are disclosed in the Plans of Development (see final EIS appendix F.10). Also, the applicant, consistent with BLM mitigation policies, has proposed compensatory mitigation actions on BLM lands. Additional discussion of these proposals has been included in section 2.1.4 and appendix F.12 of the final EIS. See also response to CO 28-264
BLM/Forest Service Topics 6	The DEIS failed to include a map of the proposed 885-acre Pacific Connector District Designated Reserve.	A map specific to the proposed District Designated Reserve (DDR) is not included in the draft or final EIS. This is because the proposed DDR is defined by specific work areas where they occur on BLM-managed lands. These areas include the permanent right-of-way, the temporary construction area, temporary work areas, temporary access roads (TARs) and permanent access roads (PARs). Pipeline facilities are within the permanent right-of-way. Communication sites are existing facilities already designated as district designated reserves. The draft EIS table 4.7.3.3-3 discloses the acres of existing land allocations where each of these work areas occurs in each BLM District. This table is also included in the final EIS.
BLM/Forest Service Topics 7	The BLM will require Pacific Connector to purchase any trees logging contractors have damaged in the Uncleared Storage Areas (UCSAs). This is a perverse incentive to damage trees in the Uncleared Storage Areas. Instead, the BLM should financially penalize companies for all damaged trees in the UCSAs, and not allow them to be cut and sold. If a tree must be cut because it was made a hazard, it should be left on site.	In accordance with the Right-of-Way Clearing Plan both the BLM and Forest Service would charge the project proponent for all merchantable timber cut within the right of way clearing, including those damaged within UCSAs. BLM varies from the Forest Service in that BLM will not consider inadvertent damage and removal of these trees trespass under BLM Regulations and Oregon Revised Statute because UCSAs would be authorized for temporary use by Pacific Connector. Liquidated damages are assessed when trees are damaged through negligence or willful action. See section 2.1.1.5 of the Right-of-Way Clearing Plan.
BLM/Forest Service Topics 8	The right-of-way clearing plan, page 8, says: “PCGP developed a Supplemental Mitigation Plan, which includes the funding of USFS and BLM restoration projects, to mitigate for the impact on these sensitive areas caused by the permanent removal of the trees that are not transported back into the areas or replanted.” Where is this “Supplemental Mitigation Plan”, especially for BLM restoration projects?	A revised Compensatory Mitigation Plan, which included proposed mitigation actions on BLM-managed lands was submitted by the applicant and is attached to the final EIS as appendix F.12. The Forest Service compensatory mitigation plan is included in appendix F.2.
BLM/Forest Service Topics 9	The BLM and Forest Service treat RRs and LSRs differently. “Trees cut within the Riparian Reserves and LSRs on BLM lands will be disposed of as determined by PCGP. Really? The BLM is allowing a foreign corporation to decide what to do with our reserved trees?”	Section 2.1.2 of the Right-of-Way Clearing Plan specifies that, “PCGP may elect to use purchased BLM or USFS timber for environmental mitigation.” BLM has declined to require storage and decking of materials for restoration or other purposes and the designation of additional TEWA for that purpose.
BLM/Forest Service Topics 10	The BLM will allow Pacific Connector to use feller bunchers on slopes up to 50%. This is excessive and damaging to soils. The Roseburg BLM doesn’t allow local operators to use a feller buncher in this manner, why would BLM give Pacific Connector special treatment? A feller buncher leaves the highest percent of ground-based detrimentally compacted soil of any harvesting type.	As disclosed in Table 4 Harvest Scenario Code List of the Right-of-Way Clearing plan, use of feller bunchers on slopes up to 50% could occur on both BLM and USFS lands within the right-of-way clearing area. Once cleared, the construction right-of-way would be subject to additional ground disturbance, trenching, and operation of heavy equipment. The effects of construction, including right-of-way clearing are disclosed in the EIS. Restoration activities following completion of construction, including amelioration of soil compaction, are proposed as part of the Plan of Development.
BLM/Forest Service Topics 11	One of the few places the draft EIS considers fire danger is on page 4-775. There, FERC claims the fire threat is under control, as explained in the Emergency Response Plan (ERP) included in appendix H to the POD. But Appendix H is only 5 pages long, with its own attachments A through E. Each of those attachments are blank, with the word “forthcoming” written on the title page.	Updated PODs have been included in the final EIS in appendix F.10.
BLM/Forest Service Topics 12	The Coos Bay BLM’s RMP (pg 82) has a “Right-of-way Avoidance Area” on the Blue Ridge route, as it is a managed recreation area. About 2 miles of the pipeline’s preferred alternative goes through the heart of the Right-of-Way Avoidance Area, as mapped in the BLM’s RMP on page 183. The LNG DEIS doesn’t mention the Avoidance Area or the impacts of a right-of-way in the right-of-way avoidance area. Appendix F.1 (evaluation of consistency with federal management plans) does quote the BLM RMP about the avoidance area (pg 19), but says the project is consistent with that plan, and gives us a range of about two hundred pages where we could find the EIS analysis. But it is NOT anywhere in the DEIS. Once the DEIS does describe the Blue Ridge Trail System Recreation Area, but never mentions that is a Right-of-Way Avoidance Area. The FEIS must correct this oversight.	All Recreation Management Areas (Special and Extensive) were designated right-of-way avoidance areas by the BLM RMPs for western Oregon completed in 2016. Direction in those plans state, “In right-of-way exclusions areas, grant rights-of-way only if the BLM determines that the right-of-way proposals are compatible with the protection of the values for which the land use was designated, or when no feasible alternative route or designated right-of-way corridor is available as applicable with BLM laws and policy.” Consult Section 4.8.1.2 and Appendix F.9 for a description of the ERMA, the associated recreational resources, and environmental impacts. While impacts to recreational uses and users would occur, associated with construction-related road and trail closures, increased traffic volumes and noise, these impacts to recreational uses and users are anticipated for the duration of construction in the area, thus short term, and would therefore not impact the recreational values for which the ERMA was designated. Appendix F.9 examines a feasible alternative to the proposed route.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION 10
1200 Sixth Avenue, Suite 155
Seattle, WA 98101-3188

JUN 28 2019

REGIONAL
ADMINISTRATOR'S
DIVISION

The Honorable Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First St., NE, Room 1A
Washington, DC 20426

Docket Numbers: CP17-494-000
CP17-495-000

Dear Secretary Bose:

The U.S. Environmental Protection Agency has reviewed the Draft Environmental Impact Statement for the Jordan Cove Energy and Pacific Connector Gas Pipeline Project (CEQ # 20190051; EPA Project Number 12-0042-AFS). Our review has been conducted in accordance with our responsibilities under the National Environmental Policy Act and Section 309 of the Clean Air Act.

Staff of the Federal Energy Regulatory Commission have prepared a DEIS for the natural gas facilities (collectively referred to as the Project) proposed by Jordan Cove Energy Project, L.P. and Pacific Connector Gas Pipeline L.P. (collectively referred to as the Applicants). The project facilities would be located within Coos, Douglas, Jackson and Klamath Counties, Oregon and designed to export an equivalent of about 1.04 billion cubic feet per day of natural gas to overseas markets.

Specific components of the Jordan Cove Energy Project include an access channel from the existing Coos Bay navigation channel to the terminal marine slip; modifications to the existing Federal Navigation Channel; a marine slip containing two berths; a dock for tug and escort boats; a material offloading facility; an LNG loading platform and transfer line; two full-containment LNG storage tanks and associated equipment; five natural gas liquefaction trains; a pipeline gas conditioning facility; a temporary workforce housing facility; a non-jurisdictional Southwest Oregon Regional Security Center and Fire Department building; and other security and control facilities, administrative buildings and support structures.

The natural gas pipeline facilities proposed by Pacific Connector include a 229-mile-long, 36-inch-diameter welded steel underground pipeline, capable of transporting up to 1.2 billion cubic feet per day of natural gas from interconnections with existing supply pipelines near Malin, Oregon; the Klamath Compressor Station; and other associated facilities (e.g., meter stations, mainline block valves, pig launchers, and communication systems).

The EPA understands that there are management challenges inherent in the mixed private/federal ownership of the project area, diverse resource needs and multiple statutory requirements. We appreciate the FERC staff effort invested in this complex project. We also want to recognize the efforts of the FERC, the Applicants and contractors to engage state and federal resource agencies, as well as Indian tribal governments, during the development of this EIS and discussion about this project. We trust this engagement will help inform the FERC's selection and development of the proposed action.

FA2 continued, page 2 of 10

The EPA served as a cooperating agency on this project and we are pleased with the progress that has been made through the NEPA process. In particular, we are supportive of the Stream Crossing Risk Analysis, which is used in conjunction with the FERC's Wetland and Waterbody Construction and Mitigation Procedures. The EPA was an early proponent of conducting a Stream Crossing Risk Analysis and we appreciate the Applicants' diligence in applying that risk matrix along the pipeline corridor. We encourage the Applicants to continue to work with the FERC to ensure that detailed, site-specific crossing plans are available to guide construction and restoration at each crossing.

Our review of the DEIS finds that while many of our concerns have been addressed, there remains the need for additional information and analyses. Our detailed comments and recommendations are included as an attachment and include the following:

- Our review of the DEIS identified questions about the proposed compensatory mitigation project at the Kentuck site and potential impacts to wetlands and aquatic resources. As the mitigation planning is finalized, we recommend the inclusion of information about final site design, site planting, and the amounts and locations of dredged materials;
- We also identified questions regarding the status of roads proposed for use and/or construction within the project area and potential associated impacts to aquatic resources. There may be roads proposed for use which will require improvement. We recommend that all roads be inventoried and their condition assessed. We also recommend assessing the potential of each road to contribute sediment to water bodies in the project area;
- We are concerned about the potential for vegetation clearing associated with pipeline construction to exacerbate solar loading to sensitive stream reaches. We recommend modifications and clarification to the mitigation measures proposed in the DEIS to minimize these potential impacts. We also recommend parity in the application of best management practices and mitigation measures between federal land and non-federal land;
- Regarding the disposal of dredged material, we appreciate the effort taken by the FERC and Jordan Cove to incorporate the initial 6.32 million cubic yards of dredged material into the upland design of the project. Jordan Cove has expressed its intent to also place material generated through maintenance dredging at an upland location. We support this plan, but advise that should Jordan Cove encounter the need to use an EPA-designated Ocean Dredged Material Disposal Site for the disposal of material generated by the Project, they will need to evaluate the material proposed for disposal using the Pacific Northwest Sediment Evaluation Framework and possibly work with the EPA to designate a new ODMS;
- Finally, we note that the Oregon International Port of Coos Bay has proposed a project to deepen, widen and lengthen the Federal Navigation Channel in the bay. We encourage the FERC to continue to coordinate with the U.S. Army Corps of Engineers and the Port to assess the potential cumulative effects to resources in Coos Bay from the Project and the proposed modifications to the Federal Navigation Channel.

Effective October 22, 2018, EPA suspended the inclusion of ratings in our comment letters. Information about this change and EPA's continued roles and responsibilities in the review of federal actions can be found on our website at: <https://www.epa.gov/nepa/environmental-impact-statement-ratings-system-criteria>.

FA2 continued, page 3 of 10

We appreciate the opportunity to review and comment on the DEIS. If you have questions about our comments, please contact Teresa Kubo of my staff at (503) 326-2859 or kubo.teresa@epa.gov, or you may contact me at (206) 553-1841 or nogi.jill@epa.gov

Sincerely,

Jill A. Nogi, Chief
Policy and Environmental Review Branch

Enclosure

**EPA Region 10 Detailed Comments on the
Draft Environmental Impact Statement for the
Jordan Cove Energy Project (Docket Nos. CP17-494-000 and CP17-495-000)**

Wetlands and Aquatic Resources (Jordan Cove Energy Project)

Proposed Compensatory Mitigation

The EPA is broadly supportive of the proposed Compensatory Wetland Mitigation Plan, which includes the Kentuck Slough Wetland Mitigation project (Kentuck project) and the proposed Eelgrass Mitigation site. The DEIS notes on page 4-130 that these mitigation projects are still being reviewed by the U.S. Army Corps of Engineers (USACE), Oregon Department of State Lands, and other applicable federal and state agencies. Until the proposed CWMP is finalized, it is difficult to determine whether the regulatory requirements to mitigate for unavoidable impacts to wetlands and waters of the U.S.¹ have been fully satisfied. We encourage the Applicants to finalize the CWMP prior to the issuance of the Final EIS so that the plan may be reviewed by the public and considered as a part of the final decision-making process for this project. We recommend that the final CWMP and EIS include the following information; although this is not intended to be an exhaustive list:

- Final Site Design. We recommend that final site design include site construction methods, such as timing and approaches to material import and dewatering, top soil salvage, mass grading, channel construction, erosion control measures, and more;
- Planting plan. We note that the January 2019 revised draft CWMP includes reference to a planting plan (Figure K-4). Our review of the planting plan finds that it is currently limited to a list of species to be used in the restoration. In order to assess the adequacy of the proposed mitigation, a more complete planting plan will be needed. We recommend that the plan include specificity regarding planting location, species, timing, spacing and number/density, as well as detail on the source for the plants, and plans for releasing (method; how often; and over what period of time). The planting plan should also cover animal pest control (what pests are present; how often control would occur; over what period of time; and control methods). We further recommend the planting plan be updated to include monitoring and adaptive management measures specific to the proposed plantings (including thresholds for plant survival that would trigger additional action).
- Projected amounts of dredged material to be disposed at the Kentuck site. Page 2-16 of the DEIS states that dredging for the marine facilities, including the marine waterway modifications, would generate about 6.32 million cubic yards of dredged and excavated material. Of that total, Table 2.1.1.8-1 indicates that 0.5 million cubic yards would be placed at the Ingram Yard, the Corridor, the South Dunes site and the Kentuck site. It is not clear from the text, DEIS Table 2.1.1.8-1, or the CWMP what proportion of that 0.5 mcy of dredged material would be deposited at the Kentuck site. We recommend this be clarified in the FEIS in conjunction with the final site design.

FA2-1

Henderson Marsh

Page 4-128 of the DEIS states that Henderson Marsh, which is located directly to the west of the terminal, may be affected due to a minor reduction in water entering the marsh from the construction of the tsunami berm on the west side of the slip. It is not clear in the text whether this potential impact has been quantified, or if there would be monitoring of Henderson Marsh during construction and operation

FA2-2

FA2 continued, page 4 of 10

FA2-01 As indicated in the EIS, the FERC defers to the U.S. Army Corps of Engineers in regards to wetland mitigation, as well as applicable State agencies. Details regarding the volume of material to be placed at the Kentuck mitigation site have been added to the EIS.

FA2-02 Impacts on the marsh have not been determined by the Army Corps of Engineers at this time.

¹ Waters of the United States (33 CFR 328.3) are subject to regulation through Sections 401 and 404 of the Clean Water Act

of the LNG terminal. To ensure that mitigation ratios are calculated correctly, it will be important for agency decision makers and the public to understand all potential wetland impacts. As noted on page 4-134 of the DEIS, USACE and ODSL may require additional mitigation (beyond what is required in this EIS) during their permitting processes.² We therefore recommend that baseline monitoring information be established for Henderson Marsh, and that a monitoring plan be put in place to identify any changes in condition within the marsh resulting from construction or operation of the terminal. In addition, we recommend that the FEIS include the mitigation measures that would be undertaken to minimize impacts should impacts to the marsh be identified.

Wetlands and Aquatic Resources (Pacific Connector Pipeline Project)

There are areas where on-site wetland delineation has not been possible due to lack of landowner permission. Although the route has been subject to screening through desktop tools and information, a full accounting of potential wetland impacts will not be possible until on-site delineation can be completed. Page 4-81 of the DEIS notes that constructing the pipeline project could affect springs, seeps, and wells that have not yet been identified. Depending on the location of a well, spring or seep relative to the pipeline, the flow of the feature could be temporarily or permanently affected. These resources could be redirected and subsequently experience changes in both water quantity and quality. To minimize potential impacts, prior to construction, the Pacific Connector project would implement the measures described in the Groundwater Supply Monitoring and Mitigation Plan (Appendix F.2 of Resource Report 2 for the Pacific Connector Pipeline).

The Groundwater Supply Monitoring and Mitigation Plan states that mitigation measures for groundwater wells, springs, and seeps would be specific to each property and would be determined during landowner negotiations. We concur that it is appropriate to tailor mitigation actions to each affected property, however we recommend that the plan include additional detail on potential mitigation options. Specifically, we recommend the inclusion of a suite of potential mitigation measures that may be pursued in the event a well, seep or spring is identified during on-the-ground surveys, and that the FEIS address implications for project implementation, particularly if minor route changes would be considered as a potential mitigation measure.

Sediment/Turbidity

Page 4-627 of the DEIS discusses the construction of access roads. Pacific Connector would construct 10 new temporary access roads, or TARs (representing 3.8 acres of disturbance), and 15 new permanent access roads, or PARs (representing 2.2 acres of disturbance). Pacific Connector would also utilize existing access roads or EARs. Total ground disturbance from existing access roads is not clear in the DEIS text, however table 4.7.2.2-2 indicates that there would be 22.5 acres of ground disturbance associated with improvements to EARs. Page 4-103 of the DEIS states that there would be about 23 EAR segments that would be within 200 feet of coho salmon-bearing streams. The DEIS also states that a total of 4 TARs, 3 PARs, and 21 EAR road segments could potentially deliver sediment to streams, due either to crossing over or being proximate to streams (within 200 feet). The DEIS does not characterize the construction right-of-way as a road, although we note that the 229-mile-long right-of-way serves the function of a road as it must be cleared and graded to support the movement of pipeline installation equipment. In addition, we note that the proposed access roads and construction right-of-way will work in concert with existing public and private roads. Page 2-45 of the DEIS states that approximately 276 miles of BLM roads, 113 miles of Forest Service roads, and 2 miles of Reclamation roads would be utilized for construction activities. Private roads do not seem to be discussed in the DEIS

² ODSL administrative rules (OAR 141-085-0690) and Section 404 of the Clean Water Act

FA2 continued, page 5 of 10

FA2-03 Additional details regarding potential measures that could be implemented have been added to the EIS.

FA2-04 Existing access roads, new temporary access roads, and new permanent access roads are described in Section 2. Environmental impacts from the road network are discussed in Section 4. Construction of access roads are shown on the pipeline facility maps in Appendix C. Areas where road modifications would be needed on existing access roads within a likely distance to possibly affect streams are indicated and some additional text added. Impacts to waterways are evaluated in Section 4.3.2 and 4.5. Pacific Connector filed a Transportation Management Plan (TMP) for federal lands as Appendix Z of its Plan of Development, and Transportation Management Plan for Non-Federal Land (TMPNFL) as Appendix F.8 to Resource Report 8. The TMPs and TMPNFL supply details of the general measures, standards, and stipulations to be employed in the use, improvement, and maintenance of roads. All maintenance would conform to BLM, Forest Service, State, county and landowner requirements and would include erosion controls. These actions would protect resources and minimize potential for adverse effects. On the ground details of where erosion controls would be applied would be determined by the EI who is charged with ensuring that project actions meet agency permit requirements. Based on these factors, a full inventory of all existing access roads and use of sediment runoff model is not required. Also see response to comment CO28-164.

FA2 continued, page 6 of 10

although we note that Resource Report 8³ includes information regarding non-public access roads. From this information, it appears that there may be over 200 miles of non-public road required for construction access. Due to Pacific Connector's proposed waterbody crossing and restoration methods, as well as the required impact avoidance and minimization measures⁴, the DEIS concludes on page 4-118 that the Project would result in short-term, localized, construction-related water quality impacts but would not significantly affect surface water resources. We have reviewed the information available in the DEIS, Pacific Connector Erosion Control and Revegetation Plan and the Travel Management Plan⁵, which, according to DEIS Table 2.6.3-1, is intended to cover all pipeline project transportation-related activities involving Agency-jurisdiction roads or rights-of-way. Our review finds that this conclusion as it relates to turbidity is not sufficiently supported. We recommend that the FEIS include the following additional detail:

- An inventory of roads to be used in project construction. Roads are delineated in the alignment sheets in Appendix H of Resource Report 1 and Appendix C of the DEIS, however the DEIS does not include information about total road mileage, road maintenance condition, surface type, or potential for hydrologic connection. There may be roads that will require extensive upgrades or maintenance before they can be used. We recommend that all road activity be disclosed in the FEIS. We also note that there are placeholders within the Travel Management Plan for maps of authorized roads to support timber removal, construction, operations and maintenance. If these maps have since been developed, they should be made available to reviewers prior to the issuance of the FEIS. Without a visual representation of where the proposed roads would be located, it is difficult for reviewers to assess potential environmental effects associated with those roads;
- Specificity about the agency-specific best management practices that will be applied, and where. We recommend that the FEIS include citations and links to the relevant BMP source documents (including BMP guidance from the Forest Service, BLM and Oregon Department of Forestry);
- An assessment of sediment risk from roads. This could be accomplished using a GIS-based tool developed by the Rocky Mountain Research Station known as the Geomorphic Road Assessment and Inventory Package or GRAIP_Lite.⁶ This would assist the FERC in determining whether any of the existing or proposed road segments or the construction right-of-way would be likely to contribute additional sediment to a waterbody. Should potential contributors of sediment be identified, we recommend that they be flagged for additional design consideration.

Stream Temperature

The DEIS discusses potential impacts to stream temperature due to pipeline construction at page 4-114, and project-specific temperature modeling on federal lands at page 4-140. The results presented demonstrate that, under drought conditions, temperatures may exceed the total maximum daily load, or TMDL, thresholds at certain crossing locations. The DEIS notes on page 4-292 that the modeling results are based on conservative assumptions and likely represent an overestimation of impact. We acknowledge these limitations and find the modeling presents credible results. Removing the vegetation

FA2-5 Information requested by the EPA related to the alignment sheets is not available and has not been identified by the Applicant at this time. Therefore, the impact assessment takes a conservative approach and considers the largest possible impact. As stated in section 4.3, impacts to stream temperatures would not be significant. We considered EPA's additional mitigation measures.

FA2 continued, page 7 of 10

from small sections of stream can result in substantial warming where the water is shallow or moving slowly.⁷

To minimize the potential effects of pipeline construction on stream temperatures from the removal of riparian vegetation, Pacific Connector has incorporated the following measures into its Project design (DEIS page 4-116):

- narrowing the construction right-of-way at waterbody crossings to 75 feet, where feasible, based on site-specific topographic conditions;
- locating temporary work areas 50 feet back from waterbody crossings to minimize impacts on riparian vegetation, where feasible;
- replanting the streambanks after construction to stabilize banks and to re-establish a riparian strip across the right-of-way for a minimum width of 25 feet back from the streambanks; and
- replanting riparian areas equal to a 1:1 ratio for temporary riparian shading vegetation losses and a 2:1 ratio for permanent riparian losses from the 30-foot operational easement clearing.

We support each of these measures and recommend the following modifications and clarifications:

- The alignment sheets do not appear to include the narrowing of the construction right-of-way from 95 feet to 75 feet as the right-of-way crosses water bodies. We appreciate that the design is not yet final, but we are sensitive to the fact that this narrowing may not be feasible at all locations. Reviewers would benefit from the identification of those water body crossings that can accommodate the narrowed right-of-way. We recommend that these crossings be identified in the final alignment sheets and incorporated by reference into the FEIS;
- We recommend that the minimum width for riparian replanting be uniform between federal and non-federal ownership. On federal land, the DEIS commits to replanting riparian areas out to 100 feet on either side of the stream. This is consistent with a broad body of science. Research comparing buffers of 98 feet (30 meters) and wider generally find these buffers perform better for maintaining shade and stream temperature than narrower buffers.⁸ Given that the bulk of riparian impacts from pipeline construction will take place on non-federal land (257 acres of impact due to construction and 56 due to maintenance), we recommend that private landowners be afforded the opportunity to request replanting out to 100 feet on either side of the stream(s) on their property; and
- We recommend that the FEIS provide additional clarity on plans for replanting in the riparian zone. Page 4-142 of the DEIS indicates that the riparian strip on federal land would generally be replanted with species such as willow cuttings and dogwood, but it is not clear whether a fully developed planting plan is available for review. We recommend that the FEIS incorporate a riparian planting plan that includes information about planting locations, species composition, timing, number/density, plant source, maintenance plans and performance standards (including thresholds for plant survival that would trigger additional action).

FA2 continued, page 8 of 10

by road or rail. The MOF would cover about three acres on the southeast side of the slip. Following construction, the MOF would be retained as a permanent feature of the LNG terminal to support maintenance and replacement of large equipment components. It is not clear from the text whether there could be utility for the MOF outside of Jordan Cove operations. We recommend that the FEIS clarify whether there is anticipated usage of the MOF outside of Jordan Cove operations. If the MOF would be utilized by outside entities, the expected type and timing of that use should be discussed, and any associated environmental impacts should be analyzed and disclosed in the FEIS.

FA2-6

Cumulative and Indirect Effects

Coos Bay Channel Modification

The DEIS discusses cumulative effects in Section 4.14. As noted on page 4-749, The Oregon International Port of Coos Bay is proposing modifications to the lower Coos Bay Federal Navigation Channel to deepen, widen and lengthen the channel.⁹ The DEIS states that detailed information on the Port's Channel Modification Project is limited at this time, but commits to incorporating information about impacts from the Channel Modification Project into the Jordan Cove FEIS as information becomes available. We concur with the FERC's assessment that the Port's Channel Modification Project would likely have the largest incremental contribution to cumulative impacts to Coos Bay. We appreciate the commitment on page 4-794 of the DEIS to consider the cumulative impacts of the Deepening Project together with the Jordan Cove project within the FEIS. We anticipate that the navigation channel timing and (potentially) the overall volume of vessel traffic could be different upon completion of the channel modification. There could also be cumulative effects to water quality (salinity and dissolved oxygen), sediment transport, eel grass and other aquatic habitat. We encourage the FERC to include detailed analysis and disclosure of the potential cumulative impacts from the modification project to these resources in the FEIS.

FA2-7

Wildlife Habitat

On page 4-797, the DEIS notes that the Project would affect about 65,000 acres of land (and associated wildlife habitats), and that some habitat types may be more sensitive to ground disturbance than others, such as those habitats defined as "irreplaceable, essential, or limited" by the Oregon Department of Fish and Wildlife. The DEIS goes on to say that "information on the extent of impacts that would occur to these sensitive habitat types as a result of reasonably foreseeable projects is not available or quantifiable at this time." Based on that statement, the DEIS goes on to conclude that "the resulting cumulative impact of the Project and the other projects would not be significant..."

FA2-8

We recommend this section be reassessed and revised for clarity. If information is lacking on potential impacts to sensitive resources, we recommend that the Applicants work with ODFW and the U.S. Fish and Wildlife Service to develop a methodology to consider potential cumulative impacts to sensitive habitat. One screen that could be applied would be to consider existing and planned features such as harvests and roads, together with project activities, including the pipeline right-of-way and access roads and where they intersect with those sensitive habitats.

Greenhouse Gas Emissions

The DEIS discusses changes in climate and greenhouse gas emissions within Section 4.14. The GHG emissions associated with construction and operation of the Project are identified in Section 4.12.1.1 for

FA2-9

FA2-7 Cumulative impacts are addressed in section 4.14.

FA2-8 Cumulative impacts are addressed in section 4.14.

FA2-9 Comment noted. We do not have enough information on the state's plans to reduce emissions to meet those goals in order to make a determination on how the project would affect the state's goals. Additionally, the state has not commented on if the project would meet its GHG reduction goals.

⁹ <https://www.portofcoosbay.com/channel-deepening>

FA2 continued, page 9 of 10

the Jordan Cove LNG Project and Section 4.12.1.2 for the Pacific Connector Klamath Compressor Station and pipeline.

We appreciate that the DEIS includes the GHG reduction goals set by the State of Oregon. Page 4-807 of the DEIS discusses GHG reduction goals set by the State of Oregon. The State seeks to achieve a 10 percent reduction from 1990 levels by 2020 and a 75 percent reduction from 1990 levels by 2050. According to the DEIS, direct emissions from the Jordan Cove LNG and Pacific Connector Pipeline Projects would result in annual carbon dioxide equivalent (CO₂e) emissions of about 2.14 million metric tons, which would represent 4.2 percent and 15.3 percent of Oregon's 2020 and 2050 GHG goals, respectively. We understand that there is state legislation under consideration that would further reduce those emissions targets. In its current form, the legislation seeks to achieve a 45 percent reduction from 1990 levels by 2035 and at least an 80 percent reduction from 1990 levels by 2050.

FA2-9
cont.

We recommend the FEIS discuss how the project would affect the ability of the State of Oregon to meet its stated carbon dioxide/GHG emissions reduction targets. If the project would significantly affect Oregon's ability to meet emissions reductions goals, then we recommend that the FEIS also include a discussion of potential mitigation strategies to reduce the impacts from the project.

Dredged Material Management

Dredged and excavated material is discussed in Section 2.1.1.8 of the DEIS. Dredging for the marine facilities, including the marine waterway modifications, would generate about 6.32 million cubic yards of dredged and excavated material. This material would be subject to upland disposal and divided among locations such as the Ingram Yard, the access utility corridor, the South Dunes portion of the site, the Roseburg Forest Products property, the Kentuck mitigation site, and the Al Pierce Company (APCO) Sites 1 and 2.

FA2-10

Maintenance dredging for the Project would occur approximately every three years, with about 115,000 cy of material removed per dredging interval for the first 12 years of operation. Subsequent maintenance dredging would be done every five years, with up to 160,000 cy of materials removed during each dredging event. Maintenance dredging of the marine waterway modifications would also be conducted every three years, with about 27,900 cy of materials removed during each dredging event. The DEIS states that Jordan Cove would also place this maintenance dredge material in an upland location (between APCO Sites 1 and 2).

We note that the DEIS states, on page 2-17, that Jordan Cove would be required to acquire a new permit for disposal of dredged material under Section 103 of the Marine Protection, Research, and Sanctuaries Act, if due to unforeseen future conditions, future dredge materials could not be distributed at the upland APCO Sites 1 and 2. We continue to state that should the Applicant ever intend to use an EPA-designated Ocean Dredged Material Disposal Site for the disposal of material generated by the project, the Applicant would need to evaluate the material proposed for disposal using the Pacific Northwest Sediment Evaluation Framework.¹⁰

Through this regulatory process, the Applicant would analyze the grain size of the proposed dredged material. Once it is determined which of the offshore disposal sites is best suited for the material, Jordan Cove would need to conduct a site capacity assessment for that site. It should not be assumed that

¹⁰ Northwest Regional Sediment Evaluation Team (RSET). 2016. Sediment Evaluation Framework for the Pacific Northwest. Prepared by the RSET Agencies, July 2016, 160 pp plus appendices

FA2 continued, page 10 of 10

capacity at these sites is static. Both the Coos Bay ODMDS Site F and Site H have received substantial volumes of dredged material in recent years, and our understanding of sediment dynamics at these sites is evolving. Previous disposals, the hydrodynamics of the nearshore area, changing winter storm intensities, and the response of the seafloor geomorphology all affect capacity and would need to be considered within Jordan Cove's site assessment. This site assessment would need to be reviewed and approved by the EPA and USACE prior to the EPA receiving a request for a permit for disposal of dredged material under Section 103 of the MPRSA.

If the site assessment were to determine that the available ODMDS would be unable to accommodate current users' needs with the addition of Jordan Cove's contribution, Jordan Cove would need to work with the EPA to designate a new ODMDS. The EPA's designation process is outlined in 40 CFR Part 228. Before a permit under the MPRSA could be issued, the USACE Regulatory Project Manager would need to submit to the EPA a public notice pursuant to 33 CFR 337.1(a)(17), 33 CFR 325.3(a)(17), 40 CFR 225.2(a)) and a MPRSA Section 103 criteria evaluation for the disposal of dredged material at an EPA designated ODMDS, based on 40 CFR 227 "Criteria for the Evaluation of Permit Applications of Ocean Dumping of Materials." As a part of the review of these materials, the EPA is required to consider impacts to potential economic effects, which would include any impacts to the USACE's ability to maintain safe navigation for the public.

We recognize and appreciate that Jordan Cove's proposed action in the DEIS does not include a Section 103 MPRSA permitting action. Nevertheless, we believe that it is important for the FEIS and the Final Order to highlight the logistical and regulatory requirements that must be met by the Jordan Cove to receive a Section 103 permit under the MPRSA, should that become necessary for this project. We recommend that the FEIS recognize that maintenance dredging is a key component to the long-term viability of the Jordan Cove project and that it is reasonable to assume that there may be changes in the availability of upland disposal locations over time.

Washington, DC 20426

Subject: COMMENTS – Jordan Cove Energy Project Draft Environmental Impact Statement,
CP17-494-000 and CP17-495-000

Dear Secretary Bose:

The U.S. Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (EIS) for the Jordan Cove Energy Project, CP17-494-000 and CP17-495-000. The Department provides the following summary of concerns and changes that require new analysis or may require adjustment of project timelines for the Federal Energy Regulatory Commission's (Commission) use in the development of the final EIS for this project.

The Bureau of Land Management (BLM) – one of the Department's component bureaus - is a cooperating agency in this proposed project and has jurisdictional responsibility under the Mineral Leasing Act to grant rights-of-way across federally managed lands for interstate natural gas pipelines. In addition, the proposed route and variations cross approximately 41-46 miles of BLM-administered lands. Because the proposed pipeline does not fully conform to the Northwestern and Coastal Oregon Resource Management Plan (RMP) (2016) and the Southwestern Oregon RMP (2016), the Federal Energy Regulatory Commission (the Commission) has included proposed plan amendments in addition to the right-of-way grant as part of the proposed action to analyze in the draft environment impact statement (EIS). The Forest Service is a cooperating agency in the project and has proposed plan amendments as part of the proposed action analyzed in the draft EIS.

As a cooperating agency, the BLM actively participated in preparing the draft EIS by providing text and appendices for inclusion in the document, providing internal review comments, and participating in interagency meetings and conference calls convened by the Commission on key topics and tasks. Following the release of the draft EIS, the BLM reviewed the document and provided technical comments and corrections to the document directly to the Commission.

FA3 continued, page 2 of 3

1. Should the Commission issue a certificate for the project, there are several requirements needed before the BLM can make a decision on the right-of-way. Depending on the time needed to complete these prerequisites, the post-the Commission certificate timelines specified under One Federal Decision may be impacted.

The BLM is unable to issue a decision until conclusion of all Section 7 consultations under the Endangered Species Act, completion of the Section 106 process under the National Historic Properties Act (NHPA), and issuance of a Section 401 Permit under the Clean Water Act. A programmatic agreement between the agencies may alleviate some of these timing concerns.

FA3-1

2. The Department recommends revising the proposed action to adhere to the U.S. Fish and Wildlife Service (USFWS) recommended timing restrictions within threshold distances of marbled murrelet and northern spotted owl stands during construction, operations, and maintenance of the pipeline facilities (draft EIS recommendation #27) in the final EIS and for inclusion in the biological assessment.

Prior to construction, the Commission has recommended that the applicant file with the Secretary of the Commission its commitment to adhere to USFWS-recommended timing restrictions. The BLM, through its right-of-way grant, will require and enforce through terms and conditions seasonal and daily timing restrictions for occupied and presumed occupied marbled murrelet stands and breeding season restrictions for northern spotted owl in accordance with the RMPs. Therefore, the BLM requests that the proposed action be revised to reflect this requirement.

FA3-2

3. The Department recommends that the Commission reconsider its conclusion that there are no significant cumulative impacts on cultural resources.

Please see the BLM technical comments submitted to the Commission for more details. A finding of significant impact to cultural resources under the National Environmental Policy Act would not preclude completion of the Section 106 consultation process under the NHPA.

FA3-3

4. The Department recommends revising the proposed action to incorporate the Blue Ridge Variation (draft EIS recommendation #16) in the final EIS and for inclusion in the biological assessment.

Prior to construction, the Commission recommended that the applicant file with the Secretary of the Commission revised alignment sheets that incorporate the Blue Ridge Variation into its proposed route for review and approval.

FA3-4

5. The Department recommends revising the proposed action to incorporate applicant-proposed voluntary mitigation actions on BLM-administered lands into the final EIS and for inclusion in the biological assessment.

FA3-5

FA3-1 Comment noted. We continued to work with the BLM per their status as a cooperating agency to develop the final EIS.

FA3-2 Comment noted. The EIS currently contains this recommendation. We continued to work with the BLM per their status as a cooperating agency to develop the final EIS and BA.

FA3-3 Comment noted. As described in section 4.11, Commission staff has determined that constructing and operating the project would result in a significant impact on cultural resources.

FA3-4 Comment noted.

FA3-5 We have worked with the BLM per their status as a cooperating agency to incorporate the applicant proposed voluntary mitigation actions on BLM-administered lands into the final EIS and BA.

FA3 continued, page 3 of 3

FA3-6 Comment noted. See section 4.9.

The BLM has received from the applicant a preliminary, voluntary mitigation proposal. Our agency will provide the Commission the best available information regarding this proposal for inclusion in the final EIS proposed action, the mitigation plan, and the biological assessment.

FA3-5
cont.

- 6. The Department recommends additional detailed analysis relative to identified significant impacts to housing in the Coos County area.

Specifically, the BLM requests that project-related temporary housing needs for both the liquefied natural gas facility and the pipeline be addressed cumulatively with other projects relative to the displacement of visitors, recreationists, and low-income residents. Additional analysis regarding rental rates and housing costs associated with the demand for temporary housing is also requested.

FA3-6

The Department intends to continue to work diligently with the Commission and the other cooperating agencies to prepare the final EIS and to address the technical comments and corrections provided by the Department, other cooperating agencies, and other commenters.

If you have any questions or concerns, please contact Allen Bollschweiler, BLM Project Manager, at 541-471-6653 or by email at abollsch@blm.gov. You may also contact Lenore Heppler, BLM Oregon/Washington Land, Mineral, and Energy Resources Branch Chief, at 503-808-6154 or lheppler@blm.gov. If you have any other questions, please do not hesitate to contact me at (503) 326-2489.

We appreciate the opportunity to comment.

Sincerely,

Allison O'Brien
Regional Environmental Officer
